
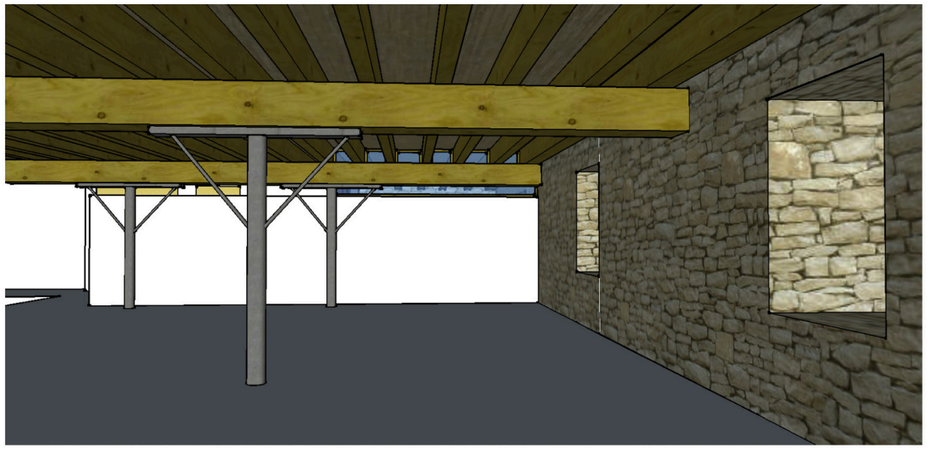
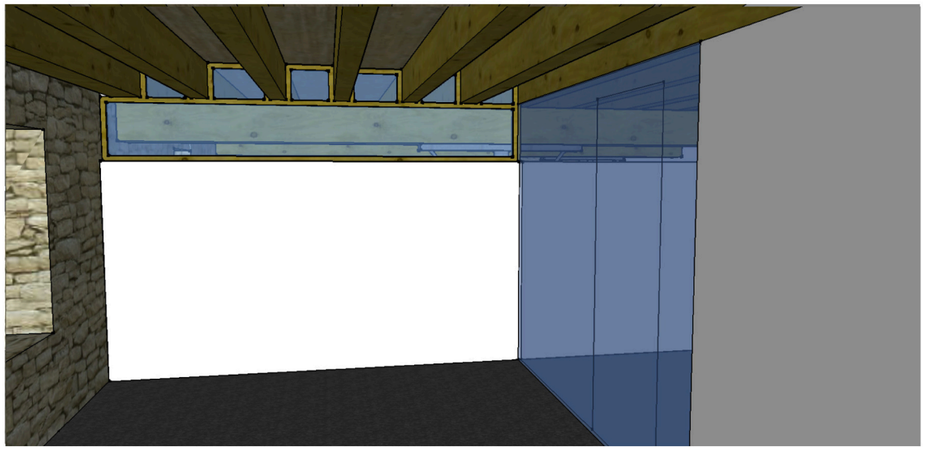
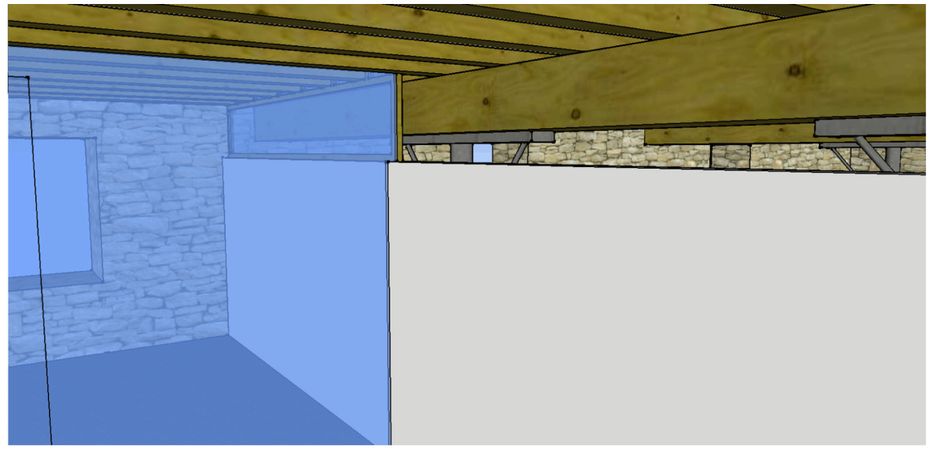
View from office reception, showing full height glass wall to conference room, partition wall in reception area lowered to provide views through but maintain degree of privacy.



View from within the main body of the office, Window provides a view into the conference room and the existing building fabric whilst providing privacy.



View from within the conference room, showing the window at high level. Window provides view of existing building fabric behind but maintains privacy. Due to irregular shapes of the beams caused by twisting and warping over time glazing would need to be framed, with frames and glazing being of various sizes/thickness which would look unsightly. Glass also at risk of cracking due to movement in the floor above.



Office successfully manages to maintain a view across the space without hiding the original features of the building.
