T1
BUILDINGS

Tree Location and description:
Please see the attached diagram. T1 is a large maple growing by the north west corner of the building at the St Lukes Centre. It has a trunk with a diameter of approximately 70-80cm and has grown with a very obvious lean towards the building.

Proposed work:
When looking at the tree from it's western side there is one large limb splitting from the trunk at approximately 2 meters and growing towards the corner of the building, i.e. southwards. This limb splits in two after approximately 1 meter with a smaller branch growing in an easterly direction. It is proposed to reduce this limb back to where this first branch splits off.
It is also proposed to reduce the overall height of the tree by approximately 20%-30%.

Reasons for work:
Due to the trees lean the customer is concerned with allowing the tree to continue growing to its full potential. They are also concerned with the amount of light the tree is taking from the rest of the garden and the property.
