

**External Plant Noise Confirmation & Compliance With Planning Conditioning 1(x) ( Acoustic Insulation of Plant)**

We confirm all the external plant is designed & installed within the limits measured by the Sixense Acoustic Design report therefore reducing the external noise levels to neighbouring bodies.

The following measures have been installed:

Kitchen extract terminates at roof level with acoustic attenuation on discharge side, further reducing break out noise from mechanical fans.

The Air conditioning condensers mounted externally on the roof have been selected & installed to minimise noise emissions and fall below the required levels. Condensers are located in the centre of the building to maximise separation distance from surrounding buildings.

External Louvres where required have acoustic attenuation to isolate the breakout noise from fans and internal building noise to the external building envelope.

Boiler plant has been installed within the building fabric at roof level. Flue systems discharges at roof level and has been designed & installed to operate within required limits.
