Executive Summary

Appointment	In June 2021 Curtins were instructed by Holmes Miller to undertake a Phase 1 Preliminary Risk Assessment of land off Kirkstead Close, Beswick, Manchester, M11 3DS. The site is centred on NGR SJ 87084 97806 and covers an area of approximately 1.92 Ha. It is understood that the site is to be redeveloped for a new club stand and associated flood lights adjacent to the rugby pitch. At the time of writing, no proposed development plans were available.
Current Site Status	The site is currently occupied by a derelict commercial building called Beswick Local Shops with large car parking adjacent with areas of landscaping near streetlights in the east of the site. A fence separates the building and car park from a built-up slope and the large rugby field to the west and north of the building. The car park slopes gently southwest towards the rugby field. The field is elevated by approximately 1m with respect to the car park.
Site History	Earliest mapping (1840's) shows the site as undeveloped, with reservoirs already established to the southeast. By 1891, the site is developed with terraced residential development across the site with several residential roads. The site is surrounded within 500m by industrial land use such as clay pits, brick works, collieries, tanneries, dye works and goods yards. From 1908, the reservoirs south of the site are backfilled. Site completely re-developed by 1974; interconnected cul-de-sacs built with one large building separated into units on site with terraced housing to the southwest and amenities directly on site such as playground, surgery and post office. Electrical substation is constructed in the centre of the site. By 1993, two buildings on southern boundary have been demolished. By 1999, a library has been built where the pub was in the north of the site. By 2006, demolition on site of buildings in the southwest of the site and is left undeveloped. Re-development of residential areas north, west and southwest of the site within 250m. Goods depot and goods sheds no longer marked 300m south of the site by the railway. Between 2006 and 2021, the site buildings have all been demolished except the western extent of the large building. As seen today, a car parking area is present to the south and east of the building on site with the landscaped field area to the west. Land north of the site within 100m re-developed for Beswick Library and East Manchester Academy.
Geology	BGS mapping indicates the site is underlain by Glacial Till superficial deposits and bedrock geology of the Etruria Formation in the southwest of the site and Pennine Upper Coal Measures in the northeast. BGS mapping records do not indicate the presence of Made Ground on site; however taking into the account that the site has undergone periods of construction and demolition since prior to the 1890s it is considered likely that Made Ground, of unknown thicknesses, underlies the site. A local BGS borehole records Boulder Clay underlying Made Ground to a depth of 15.24m bgl with subordinate silty sand beds but as no BGS borehole records extend to bedrock it is unknown what depth bedrock underlies the site in either Etruria Formation or Pennine Upper Coal Measures. The site is located in a low probability radon area where <1% of homes are estimated to be at or above the radon Action Level.
Mining	The site is located within a Coal Mining reporting area. The site is not located within a Development High-Risk Area and there are no recorded mine entries, coal workings or probable coal workings within 100m of the site. The risk from shallow coal mining is therefore considered to be Low.
Hydrogeology	The site is underlain by a Secondary, undifferentiated, Aquifer associated with the superficial deposits and Secondary A Aquifers in the bedrock (Etruria Formation and Pennine Upper Coal Measures Fm). The site is not located within a Source Protection Zone (SPZ). There are no groundwater abstraction points within 500m of the site.
Hydrology	The nearest surface water feature 597m southeast of the site and is a pond. There are no surface water abstractions within 700m. There no discharge consents within 250m of the site.
Unexploded Ordnance	Online UXO risk mapping identifies the site as being in a moderate-risk area. Due to no identified bomb-damaged areas within 150m of the site, risk from UXO is considered to be Low therefore no further action is required. If unexploded ordnance is discovered during any works, stop immediately, prevent access to the area, and inform the police. If the site boundary or location changes then the UXO risk should be reassessed.
Initial Ground Contamination Assessment	The risk from Made Ground posed to the site's end-users is considered to be Moderate/Low taking into account the site's historical land use and periods of redevelopment.

	The risk posed to surface water and groundwater is considered to be Very Low and Low respectively due to proximity to a sensitive surface water feature and the thickness of low permeability superficial deposits underlying the site over Secondary A Aquifers in both the Etruria Fm and Pennine Upper Coal Measures Fm. The risk posed to site end-users from ground generating gases arising from Made Ground and demolition materials on the site is considered to be Moderate/Low accounting for the anticipated thicknesses of Made Ground soils underlying the site.
Recommendations	The following recommendations are made with regards to further works at the site: 1. Undertake an intrusive ground investigation. 2. Undertake a GQRA as part of the ground investigation; 3. PCB Testing to be undertaken if visual or olfactory evidence suggests contamination of shallow site soils in the immediate vicinity of the substation; and 4. Undertake Ground Gas Monitoring over a period of three months for methane, carbon dioxide, oxygen, hydrogen sulphide, gas flow in l/hr, weather conditions and barometric pressure (with confirmation if falling, steady or rising). It is further recommended that this work is completed in advance of any development works taking place.

1.0 Introduction

1.1 Project Background

In June 2021 Curtins were instructed by Holmes Miller to undertake a Phase 1 Preliminary Risk Assessment of land off Kirkstead Close, Beswick, Manchester, M11 3DS.

The location and extent of the site is shown in *Figure 2.1*. It is understood that the site is to be redeveloped for new rugby stand and associated flood lights adjacent to the rugby pitch. Proposed development plans are included in *Appendix A*.

1.2 Scope of Services

The Phase 1 Preliminary Risk Assessment (PRA) is intended to provide an overview of the geo-environmental and geotechnical setting of the site, prior to the proposed development of the site.

Through this overview, the Phase 1 PRA aims to develop both a working conceptual and ground model for the site, as well as present an initial assessment of any risks that could be presented to the development including its intended end users and the wider environment.

Specifically, the Phase 1 PRA provides an initial assessment of the site regarding:

- a) Potential on and offsite contamination from historical and/or current uses, including potential ground gas generating sources;
- b) The potential impact on the wider environment by historical and or current use of the site of interest;
- c) The potential impact from surrounding land uses and other environmental factors;
- d) Potential problems associated with geological features such as faulting, mineral extraction, mining and land instability; and
- e) The location of apparent sub-surface structures that may affect the proposed redevelopment.

Consideration of detailed flood risk, ecology and archaeological issues are outside of the scope of this report.

2.0 Current Site and Surrounding Area Details

2.1 Site Location and Current Details

Site use, location and description are shown below in *Table 2.1* and *Figure 2.1*.

Table 2.1 – Site Details

Site Address	Kirkstead Close, Beswick, Manchester, M11 3DS
NGR	SJ 87084 97806
Area of Site	Approximately 1.92 Ha
Current Site Use and Description	The site is currently occupied by a derelict commercial building called Beswick Local Shops and a large car park adjacent with small areas of landscaping near streetlights in the east of the site. A fence separates the building and car park from a built-up slope and the large rugby field to the west and north of the building. The northern boundary is marked by the perimeter of Beswick Library and East Manchester Academy running just north of the rugby field; the eastern boundary is marked by fencing along Grey Mare Lane. The western boundary is marked by the garden fences of private residential properties on Metcombe Way. The southern boundary is marked by landscaping along Bell Crescent. Metal fencing surrounds the site to the south, wooden fencing along western boundary and some fencing along eastern boundary with some cut throughs onto Grey Mare Lane. Residential dwellings are located to the south and southwest. Beswick Library and East Manchester Academy school grounds present north of the site. The East Manchester Leisure Centre is to the east. Alan Turing Way is present further east. The car park slopes gently southwest towards the rugby field. The rugby field is elevated by approximately 1 meter with respect to the car park.

Figure 2.1 – Site Location Plan (site boundary shown in pink. 250m and 500m buffers in purple).

2.2 Surrounding Area Details

The following information was established through undertaking an environmental database search. The full Envirocheck report (Ref. 1) is included in *Appendix B*.

Table 2.2 – Surrounding Land Uses

Surrounding Area	N	Beswick Library and East Manchester Academy grounds.
	E	East Manchester Leisure Centre and Manchester City Training Ground further east of Alan Turing Way.
	W	More school playing fields and Metcombe Way and residential estates further west.
	S	Bell Crescent and more residential estates and some commercial businesses.

3.0 Site History

A review of the available historical mapping and other information for the site, as presented within the Envirocheck Report (Ref. 1), has been undertaken and is presented in *Table 3.0* below.

Table 3.0 – Previous Site and Surrounding Area Uses and Potential Sources of Contamination. *Bold text refers to on-site activity.*

Date	Description	Potential Sources of Contamination
1848 – 1891	The site is undeveloped. Two field boundaries encroach the western area of the site. Two reservoirs are located approximately 30m southeast of the site. Bradford Bleach Works is shown less than 100m east of the site and Clayton Dye Works is further east >500m from the site. Several clay pits and brick works are shown within 500m south of the site. Clayton Colliery is noted within 500m northeast of the site and Bradford Tannery are Bradford Colliery are within 300m and 600m north of the site respectively.	• Limited potential for deposition of Made Ground and contamination on site. • Potential for contamination arising from Bradford Bleach Works to the east
1891 – 1894	Terraced residential development across the site with several residential roads crossing the site. Openshaw Dye Works are located from 100m south and, southeast. A chemical works is noted 150m northeast. Bradford Bleach Works is no longer mapped to the east by the 1890s. Clayton Colliery to the northeast is no longer mapped, replaced by a Mill and Chemical Works from 400m. Reservoirs with a sluice gate are still present just south of the site. Major residential development to the north and west of the site within 250m. Cricket ground is present within 100m west of the site. Tramway is constructed 150m south of the site. Coal and Mineral Depot and Goods Yards are present near the railway lines from 750m southwest of the site.	• Uncontrolled deposition of Made Ground during construction of residential dwellings on site. • Potential for contamination arising from local industrial land use including the chemical works and dye works within 100m.
1908 – 1933	Continued terraced housing development in the east of the site. Tramway constructed to the east of the site encroaching the eastern boundary. From 1908, the reservoirs south of the site are backfilled and the associated Dye Works and Chemical Works are demolished; with St Aiden's Church and Rectory constructed with terraced housing to the to the west and east of the church and a school to the south. Cricket ground re-developed with terraced housing streets within 250m west of the site. Significant re-development in the wider vicinity with some brick works and clay pits still present within 200m south of the site. Several industrial works are present now along the railway lines to the south such as an engineering works and gas engine works approx. 300m from the site. Bradford Colliery 500m north is no longer mapped.	• Uncontrolled deposition of Made Ground during construction of terraced housing and tramway on site. • Uncontrolled deposition of Made Ground during construction of new industrial works and St Aiden's Church off site. • Potential for contamination from industrial works within 250m of the site.
1948 – 1967	Limited change of land use on site. Tramway located to the east on the site is de-constructed. By 1949, an electrical substation and a model dairy are noted from 20m southeast. Tripe Works is noted from approx. 70m	• Uncontrolled deposition of Made Ground during de-construction of tramway on site. • Potential for uncontrolled deposition of Made Ground from

Date	Description	Potential Sources of Contamination
	northeast. An unnamed works and warehouse are noted 100m south of the site. Goods sheds and the Ardwick East Goods Depot is noted just over 250m south of the site. Post-WWII mapping shows small ruins located 50m and 150m southeast. By 1963, the model dairy is renamed as a depot.	demolition and reconstruction of industrial buildings off site within 100m. • Potential for contamination arising from industrial works off site within 100m.
1974 – 1999	Site completely re-developed by 1974; interconnected cul-de-sacs built with one large building separated into units on site with terraced housing to the southwest and amenities directly on site such as playground, surgery and post office. Electrical substation is constructed in the centre of the site. There is a pub noted in the north of the site. By 1977, a bank is noted in the centre of the site by the substation. By 1988, a number of rows of terraced properties have been demolished across the southern and central area of the site. 1992 mapping shows some new housing constructed in the southern area. By 1994 the public house in the northern corner of the house is mapped as a Library. By 1974, demolition of depot to the south and industrial works from 50m east of the site and re-development with primary school and markets. A health centre is constructed within 100m north of the site. St Aiden's Church has been demolished by 1977. A new police station is constructed from 20m southeast of the site by 1988. By 1979, re-development west of the site has changed the residential terraced housing into two new churches and an area of undeveloped land. By 1993, industrial works are still present 250m east of the site. Goods sheds associated with the railway 250m south of the site is present with undeveloped land north of Ashton Old Road with new terraced housing developed just north of that. By 1995, Alan Turing Way has been constructed 100m east of the site	• Deposition of Made Ground associated with demolition and construction of terraced housing, with potential for backfilled basements on site. • Uncontrolled deposition of Made Ground during construction of buildings of new roads and pub with possible basements on site. • Potential for fuel/oil spills in hardstanding areas used around buildings on site and notably potential for contamination of polychlorinated biphenyl's from the substation on site. • Potential for uncontrolled deposition of Made Ground from demolition of housing and construction of new buildings off site.
2006 – Present	Demolition of all buildings on site and except the western extent of the large building. The substation remains in place on site. Car parking area present to the north and east of the building on site as seen in present with the landscaped field area to the south and west. Redevelopment of the surrounding area within 500m of the site, East Manchester Academy constructed with new buildings directly north of the site. Large, landscaped area northwest of the site adjacent to the landscaping on site. By 2006, 750m north of the site there is major development of new football stadium and in the surrounding area. Large building developed in place of market approx. 70m east of the site. Large football academy buildings and field areas developed further east of Alan Turing Way approx. 600m from the site.	• Deposition of Made Ground associated with demolition of buildings on site. • Potential for contamination of polychlorinated biphenyl's from the substation, and fuel/oil spills in hardstanding car parking areas used around large building on site. • Deposition of Made Ground from demolition and construction of Academy and new buildings 100m north of the site.

Potential sources of onsite contamination are further discussed in *Section 6.0*.

4.0 Geology, Hydrogeology and Hydrology

4.1 Geology and Hydrogeology

A study of the Envirocheck (Ref. 1) Report and the British Geological Survey (BGS) 1:50,000 mapping records (Solid and Drift) for Manchester (Sheet 085) dated 2010 (Ref. 2) indicates the following geological and hydrogeological succession underlying the site:

Table 4.1 – Geological/Hydrogeological Succession

Geology	Associated Hydrogeological Classification
Glacial Till – Devensian, Diamicton ¹	Secondary Aquifer, Undifferentiated ²
Etruria Formation – Sandstone and Mudstone ³ (southwestern area)	Secondary A Aquifer ⁴
Pennine Upper Coal Measures Formation – Mudstone, Siltstone and Sandstone ⁵ (northeast of the site)	

Notes:

1. A heterogeneous mixture of clay, sand, gravel, and boulders varying widely in size and shape.
2. These layers have not been assigned an attribute either category A or B rock type due to not being possible. In most cases, this means that the layer in question has previously been designated as both minor and non-aquifer in different locations due to the variable characteristics of the rock type.
3. Red, purple, brown, ochreous, green, grey and commonly mottled mudstone, with lenticular sandstones and conglomerates
4. These are permeable layers capable of supporting water supplies at a local rather than strategic scale, and in some cases forming an important source of base flow to rivers. These are generally aquifers formerly classified as minor aquifers;
5. Interbedded grey mudstone, siltstone and pale grey sandstone, commonly with coal seams, but no mudstones containing marine fossils are present.

Superficial deposits of Glacial Till are recorded across the site overlying; in the southwestern half of the site the Etruria Formation, and in the northeastern half of the site the Pennine Upper Coal Measures.

There are several BGS borehole records (Ref. 3) located within 250m of the site boundary. However, most of these boreholes are restricted or shallow trial pit excavations which do not give relevant information of deeper ground conditions. There is one borehole located 240m east of the site, summarised in Table 4.2 below, however it is not advanced into bedrock.

Table 4.2 – BGS Borehole Record

Record Reference	Location (NGR)	Details (bottom to top of strata/details/thickness of strata)
SJ89NE1117	Off Site 240m east (387390,397800)	0.00m to 0.91m bgl Ash fill. (0.91m)
		0.91m to 1.37m bgl Firm, grey/brown mottled, sandy clay with stone inclusions. (0.46m)
		1.37m to 2.13m bgl Stiff, brown, silty sandy clay with grey fissures and occasional stone inclusions. (0.76m)
		2.13m to 3.81m bgl Stiff, brown sandy clay with stone inclusions. (1.68m)
		3.81m to 5.94m bgl Stiff, brown, silty sandy clay with stone inclusions. (2.13m)
		5.94m to 7.01m bgl Stiff, brown, sandy clay with stone inclusions. (1.07m)
		7.01m to 7.92m bgl Stiff to very stiff, brown, sandy clay with stone inclusions. (0.91m)

Record Reference	Location (NGR)	Details (bottom to top of strata/details/thickness of strata)	
		7.92m to 11.13m bgl	Brown, silty sand with lenses of silt and clay. (3.21m)
		11.13m to 12.50m bgl	Obstruction- possible boulder. (1.37m)
		12.50m to 15.24m bgl	Hard brown sandy and very sandy clay with frequent lenses of silty fine sand. (2.74m)
		15.24m bgl	Borehole complete

BGS mapping records do not indicate the presence of Made Ground on site; however the BGS borehole log in the area east of the site records Made Ground to 0.91m bgl as seen in Table 4.2, therefore it is considered likely that Made Ground in limited thicknesses underlies the site.

Boulder Clay is recorded to underlie the Made Ground to a depth of 7.92m bgl with a subordinate silty sand strata overlying sandy clay to a depth of 15.24m bgl, but as no BGS borehole records extend to bedrock it is unknown what depth bedrock underlies the site in either Etruria Formation or Pennine Upper Coal Measures.

The site is not situated within a Source Protection Zone (SPZ).

There are no groundwater abstraction points located within 500m of the site. There are no groundwater abstractions for potable water supplies located within 1km of the site.

4.1.1 Mining

A review of the Coal Authority interactive mapping (Ref. 4) for the area indicates that the site is located within a Coal Mining Reporting Area, however it is not located within a Development High-Risk Area.

There are two recorded mine entries within 250m of the site, the nearest being approximately 100m east of the site, both are recorded as shafts. The site is not within the zone of influence of the mine entries.

There are no recorded coal workings and no probable coal workings within 500m of the site.

Consequently, the risk to development from historic coal mining is considered to be **Low**. No further actions are required to further assess the risk to development from historic coal mining.

There are six inactive BGS recorded mineral sites within 500m of the site, the nearest being 213m southwest of the site and associated with the Beswick Brick Field as an opencast clay pit. One of these was an underground operation, Clayton Colliery located 388m northeast where deep coal was extracted.

4.1.2 Other Ground Stability Issues

The Envirocheck Report (Ref. 1) confirms that there is a no hazard to very low risk from the following ground stability hazards on the site; collapsible ground, compressible ground, ground dissolution, landslide ground, running sands, and shrinking or swelling clay.

4.1.3 Ground Gas

Given historic development on site, it is likely that thicknesses of Made Ground and demolition material may be present on site. Given the thicknesses anticipated, these soils may act as a source of gas generation.

There are no historical landfill sites recorded within 700m of the site.

There are seven potentially infilled water features within 250m of the site; the nearest being 23m southeast of the site, historical mapping suggests this is the infilled reservoir and is a potential gas generating feature within influencing distance of the site. There is one potentially infilled land feature within 250m of the site, recorded to be 128m southwest of the site and is also a potential gas generating feature.

The Envirocheck Report (Ref. 1) and BGS Radon Mapping (Ref. 5) confirms the site is situated in an area where <1% of homes are above the radon action level. Radon protection measures are therefore not considered necessary within the proposed development. The new development will not incorporate a basement as such advice of a specialist Radon assessor is not required for this site.

4.2 Hydrology

The nearest surface water feature identified by the Envirocheck report (Ref.1) is 597m to the southeast which is a pond.

There are no recorded pollution incidents to controlled waters in the past 20 years within 1km of the site.

There are no surface water abstractions within 700m.

There are no discharge consents within 250m of the site.

5.0 Unexploded Ordnance Risk Assessment

Military activities including those conducted as part of both the First and Second World Wars have resulted in a legacy of unexploded ordnance (UXO) being present within the shallow soils of the UK.

UXO result from various sources including both allied (military training) and German (bombing raids) with a guide figure of approximately 10% of all munitions failing to function as designed.

The likelihood of UXO being encountered on a development site is influenced by several factors including; the proximity to strategic targets, the nature of the development works being undertaken and evidence of local damage in the post-war periods amongst others. To determine the likelihood of UXO being present on a site, a step-wise risk assessment process is followed. This process is outlined within CIRIA C681 Unexploded Ordnance: A Guide for the Construction Industry (Ref. 6) with the following commentary considered to represent a Preliminary Risk Assessment intended to guide if and where there is a requirement for a Detailed Risk Assessment.

5.1 Preliminary UXO Assessment

Risk mapping (Ref. 7) for UXO's has placed the site in a **Moderate** risk area. Moderate-risk regions are those with a bombing density of less than 15 to 50 bombs per 1000 acres.

A review of the available post-WWII historic mapping identified two small ruins approx. 50m and 150m southeast.

Figure 5.1 – Site boundary shown in pink.

A review of available online bomb damage mapping for Manchester (Ref. 8, *Figure 5.1*) shows no bombing damage on or within 150m of the site.

Considering the above and that the site has been re-developed several times since WWII so any UXO on site would likely have been encountered, the risk of encountering potential UXO as part of future intrusive works is considered **Low**, and no further action is required.

If unexploded ordnance is discovered during any works, stop immediately, prevent access to the area, and inform the police. If the site boundary or location changes then the UXO risk should be reassessed.

6.0 Conceptual Site Model & Qualitative Risk Assessment

The conceptual site model (CSM) and Qualitative Risk Assessment (QRA) are presented in the table within this section.

The CSM details the source-pathway-receptor linkages or potential pollutant linkages (PPL) that have been identified for the site. The QRA details the associated level of risk relating to these potential pollutant linkages.

The CSM and QRA concern risk to human health and water environment with additional, more specific risk assessment protocols contained within the main body of this reporting, as detailed in *Section 6.1* below.

The QRA follows the framework outlined within CIRIA C552 (Ref. 9) which is summarised within *Appendix C*.

The 'risk rating' within the QRA refers to the risk that the source, pathway, receptor linkage or PPL is complete. Unless specifically stated it does not necessarily refer to an immediate risk and is intended to be used as a tool to assess the necessity for further assessment/investigation.

6.1 Additional Risk Assessments

The following risk assessments, listed below, are not included within the main CSM and QRA but nonetheless can be of critical importance to the onward development of the site:

- The risk presented by Mining is discussed and assessed in *Section 4.1.1*.
- The risk presented by Radon is discussed and assessed in *Section 4.1.3*.
- The risk presented by Unexploded Ordnance is discussed and assessed in *Section 5.0*.

Under current health and safety legislation, employers are required to carry out their own appropriate risk assessments and mitigation to protect themselves and their employees, other human receptors and the environment from potential contamination. Such risks must be adequately mitigated by law, specifically the Construction Design Management (CDM) Regulations, 2015 (Ref. 10) which require that potential risks to human health and the environment from construction activities are appropriately identified and all necessary steps taken to eliminate / manage that risk. It has been assumed that any future construction works on site will be undertaken in compliance with these requirements.

Qualitative Risk
Assessment

Generic
Quantitative Risk
Assessment

Detailed
Quantitative Risk
Assessment or;
Remedial Action

- The table below represents the first stage in the land quality risk assessment process: The Qualitative Risk Assessment.
- For a development site to be deemed 'suitable for use', the level of risk needs to be brought down to acceptable levels, i.e. low to very low risk. The purpose of each stage of risk assessment is ultimately to establish, if there is a requirement for additional levels of assessment to be made to have sufficient confidence to support a risk characterisation or management decision, e.g. remedial action.
- In the absence of specific site data, a Generic Quantitative Risk Assessment is invariably recommended.

Conceptual Site Model			Qualitative Risk Assessment			Recommended Actions
Source	Pathway(s)	Receptor(s)	Consequence	Likelihood of Occurrence	Risk Rating	
Significant sources of on-site contamination: - Made Ground of unknown composition from uncontrolled deposition of materials associated with previous phases of development including construction and demolition of the terraced residential dwellings and associated possible basements, unnamed commercial buildings, including asbestos from buildings demolished pre-2000. - Potential for contamination notably polychlorinated biphenyls from the electrical substation. - Potential for contaminants associated with the site's use (in hardstanding areas) as a car park, fuels and oil leaks/spills. Significant sources of off-site contamination: - Uncontrolled deposition of Made Ground during the construction of new roads, residential dwellings and industrial land use adjacent to the site's boundaries.	Direct contact, ingestion, inhalation (dust and vapours)	End-user of site (Rugby stand end-users) & Construction Workers	Medium Chronic health risk	Low Likelihood Based on the site's historical use as a residential estate then commercial estate with electrical substation and then car park, the likelihood of encountering significant contamination in the Made Ground is considered to be low taking into consideration the lack of industrial land use on site. Likelihood of construction workers coming into contact with contamination on site can be reduced by appropriate PPE.	Moderate / Low	Generic Quantitative Risk Assessment Recommended as part of the ground investigation. PCB Testing to be undertaken if visual or olfactory evidence suggests contamination of shallow site soils in the immediate vicinity of the substation.
	Vertical migration through the superficial deposits (soils) May occur due to existing service corridors and physical processes including: capillary action and downwards flow into the natural deposits through infiltration.	Controlled Waters (Groundwater) Secondary A Aquifer (Etruria Fm and Upper Pennine Coal Measures) overlain by Glacial Till (Secondary Undifferentiated Aquifer). There are no active potable groundwater abstraction points within 1km. The site is not within a designated Source Protection Zone.	Medium Pollution of sensitive water resources	Unlikely Taking into account the lack of SPZ and potable abstractions points within 1km, and the thickness of low permeability clay overlying the bedrock (>10m), it is considered unlikely that contamination in soils would negatively impact the Secondary A Aquifer.	Low	No further action required unless gross contamination identified in site soils in GI.
	Horizontal migration over and through the superficial deposits (soils)	Controlled Waters (Surface Water) Nearest surface water feature is a pond 597m southeast of the site. Six surface water abstraction points within 1km.	Mild Pollution of non-sensitive water resources	Unlikely Considering the distance from the site to the nearest sensitive surface water receptor and likely presence of cohesive superficial soils, this pathway is considered unlikely.	Very Low	No further action required
Significant sources of ground gas: - Potential for unknown thickness of Made Ground and demolition material on site. - Infilled water features within 100m of the site boundary.	Vertical and horizontal migration through existing service corridors and the underlying superficial deposits	End-user of site (Rugby stand end-users)	Medium Human health risk	Low Likelihood Unknown thickness of made ground present, but taking into account that made ground soils are likely predominantly low in putrescible material reflecting construction and demolition material	Moderate / Low	Generic Quantitative Risk Assessment Recommended as part of the ground investigation.

7.0 Conclusion and Recommendations

The qualitative risk assessment (QRA) determined a varied level of level of risk associated with the proposed development.

The QRA concluded by recommending that generic quantitative risk assessments (GQRA) were conducted to confirm the assessment of risk ascribed to each of the respective potential pollutant linkages (PPLs). It is recommended that the GQRA is conducted as part of a ground investigation in support of the engineering design of the proposed development.

In summary, the following recommendations are made:

- Undertake an intrusive ground investigation;
- Undertake a GQRA as part of the ground investigation;
- PCB Testing to be undertaken if visual or olfactory evidence suggests contamination of shallow site soils in the immediate vicinity of the substation; and
- Undertake ground gas monitoring over a period of three months for potential hazardous gases.

It is further recommended that the site investigation works are completed in advance of any development works taking place.

7.1 Contaminants of Concern

Potential contaminants of concern associated with the sources identified within the Conceptual Site Model in *Section 6.0* of this reporting include but are not limited to: broad range aliphatic and aromatic hydrocarbons present within any fuel oils; polycyclic aromatic hydrocarbons (PAHs); inorganic compounds including heavy metals; and asbestos present in discarded building materials. Analysis of polychlorinated biphenyls should be undertake on soil samples in the immediate vicinity of the substation if visual or olfactory evidence of contamination is recorded during the investigation.

Potential contaminants associated with airborne dust/particulates include but are not limited to: polycyclic aromatic hydrocarbons and inorganic compounds including toxic metals that are also accounted for by potential onsite contaminants of concern.

7.2 Other Considerations

The requirement for additional surveys, e.g. arboricultural and ecological surveys, should be confirmed through advice from a suitably qualified and experienced professional.

Introduction

The Environment Act 1995 has made site sensitivity a key issue, as the legislation pays as much attention to the pathways by which contamination could spread, and to the vulnerable targets of contamination, as it does the potential sources of contamination. For this reason, Landmark's Site Sensitivity maps and Datasheet(s) place great emphasis on statutory data provided by the Environment Agency/Natural Resources Wales and the Scottish Environment Protection Agency; it also incorporates data from Natural England (and the Scottish and Welsh equivalents) and Local Authorities; and highlights hydrogeological features required by environmental and geotechnical consultants. It does not include any information concerning past uses of land. The datasheet is produced by querying the Landmark database to a distance defined by the client from a site boundary provided by the client. In this datasheet the National Grid References (NGRs) are rounded to the nearest 10m in accordance with Landmark's agreements with a number of Data Suppliers.

Index Map

For ease of identification, your site and buffer have been split into Slices, Segments and Quadrants. These are illustrated on the Index Map opposite and explained further below.

Slice
Each slice represents a 1:10,000 plot area (2.7km x 2.7km) for your site and buffer. A large site and buffer may be made up of several slices (represented by a red outline), that are referenced by letters of the alphabet, starting from the bottom left corner of the slice "grid". This grid does not relate to National Grid lines but is designed to give best fit over the site and buffer.

Segment
A segment represents a 1:2,500 plot area. Segments that have plot files associated with them are shown in dark green, others in light blue. These are numbered from the bottom left hand corner within each slice.

Quadrant
A quadrant is a quarter of a segment. These are labelled as NW, NE, SW, SE and are referenced in the datasheet to allow features to be quickly located on plots. Therefore a feature that has a quadrant reference of A7NW will be in Slice A, Segment 7 and the NW Quadrant.

A selection of organisations who provide data within this report:

Envirocheck reports are compiled from 136 different sources of data.

Lancashire And Furness

Published 1891

Source map scale - 1:500

The 1:500 scale Ordnance Survey mapping was introduced in 1855 as a replacement for the 1:528 scale and to compliment the 1:2500 scale that had been implemented in 1853. By 1895, the 1:500 scale covered most towns over a population of about 4000 at the time of survey, although very few towns were mapped more than once at this scale, and none have been since 1910. The 1:500 scale gives particular emphasis to such features as lamp posts, man holes, arched passages and minor building projections. Also often featured are divisions between tenements, interior ground floor layouts of public buildings, and on earlier plans, the functions of the various parts of larger industrial premises are also indicated. Content of the plans does vary however, from one town to the next in terms of, for example, the completeness of railway tracks and the coverage of public buildings.

Please note: Due to the partial coverage of Historical Town Plans, it is possible that not all segments within an order will contain mapping. Only the segments that have Town Plan coverage will be generated.

Lancashire And Furness

Published 1893

Source map scale - 1:2,500

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840's. In 1854 the 1:2,500 scale was adopted for mapping urban areas and by 1896 it covered the whole of what were considered to be the cultivated parts of Great Britain. The published date given below is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas.

Supply of Unpublished Survey Information

Published 1974

Source map scale - 1:1,250

SUSI maps (Supply of Unpublished Survey Information) were produced between 1972 and 1977, mainly for internal use at Ordnance Survey. These were more of a 'work-in-progress' plan as they showed updates of individual areas on a map. These maps were unpublished, and they do not represent a single moment in time. They were produced at both 1:2,500 and 1:1,250 scales.

Large-Scale National Grid Data

Published 1995

Source map scale - 1:1,250

'Large Scale National Grid Data' superseded SIM cards (Ordnance Survey's 'Survey of Information on Microfilm') in 1992, and continued to be produced until 1999. These maps were the fore-runners of digital mapping and so provide detailed information on houses and roads, but tend to show less topographic features such as vegetation. These maps were produced at both 1:2,500 and 1:1,250 scales.

Lancashire And Furness

Published 1848

Source map scale - 1:10,560

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840's. In 1854 the 1:2,500 scale was adopted for mapping urban areas; these maps were used to update the 1:10,560 maps. The published date given therefore is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas. In the late 1940's, a Provisional Edition was produced, which updated the 1:10,560 mapping from a number of sources. The maps appear unfinished - with all military camps and other strategic sites removed. These maps were initially overprinted with the National Grid. In 1970, the first 1:10,000 maps were produced using the Transverse Mercator Projection. The revision process continued until recently, with new editions appearing every 10 years or so for urban areas.

Lancashire And Furness

Published 1938

Source map scale - 1:10,560

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840's. In 1854 the 1:2,500 scale was adopted for mapping urban areas; these maps were used to update the 1:10,560 maps. The published date given therefore is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas. In the late 1940's, a Provisional Edition was produced, which updated the 1:10,560 mapping from a number of sources. The maps appear unfinished - with all military camps and other strategic sites removed. These maps were initially overprinted with the National Grid. In 1970, the first 1:10,000 maps were produced using the Transverse Mercator Projection. The revision process continued until recently, with new editions appearing every 10 years or so for urban areas.

Manchester

Published 1975

Source map scale - 1:25,000

These maps were produced by the Russian military during the Cold War between 1950 and 1997, and cover 103 towns and cities throughout the U.K. The maps are produced at 1:25,000, 1:10,000 and 1:5,000 scale, and show detailed land use, with colour-coded areas for development, green areas, and non-developed areas. Buildings are coloured black and important building uses (such as hospitals, post offices, factories etc.) are numbered, with a numbered key describing their use.

They were produced by the Russians for the benefit of navigation, as well as strategic military sites and transport hubs, for use if they were to have invaded the U.K. The detailed information provided indicates that the areas were surveyed using land-based personnel, on the ground, in the cities that are mapped.

10k Raster Mapping

Published 1999

Source map scale - 1:10,000

The historical maps shown were produced from the Ordnance Survey's 1:10,000 colour raster mapping. These maps are derived from Landplan which replaced the old 1:10,000 maps originally published in 1970. The data is highly detailed showing buildings, fences and field boundaries as well as all roads, tracks and paths. Road names are also included together with the relevant road number and classification. Boundary information depiction includes county, unitary authority, district, civil parish and constituency.

VectorMap Local

Published 2021

Source map scale - 1:10,000

VectorMap Local (Raster) is Ordnance Survey's highest detailed 'backdrop' mapping product. These maps are produced from OS's VectorMap Local, a simple vector dataset at a nominal scale of 1:10,000, covering the whole of Great Britain, that has been designed for creating graphical mapping. OS VectorMap Local is derived from large-scale information surveyed at 1:1250 scale (covering major towns and cities), 1:2500 scale (smaller towns, villages and developed rural areas), and 1:10 000 scale (mountain, moorland and river estuary areas).

Geology 1:50,000 Maps

This report contains geological map extracts taken from the BGS Digital Geological map of Great Britain at 1:50,000 scale and is designed for users carrying out preliminary site assessments who require geological maps for the area around the site. This mapping may be more up to date than previously published paper maps.

The various geological layers - artificial and landslip deposits, superficial geology and solid (bedrock) geology are displayed in separate maps, but superimposed on the final 'Combined Surface Geology' map. All map legends feature on this page. Not all layers have complete nationwide coverage, so availability of data for relevant map sheets is indicated below.

Artificial Ground and Landslip

Artificial ground is a term used by BGS for those areas where the ground surface has been significantly modified by human activity. Information about previously developed ground is especially important, as it is often associated with potentially contaminated material, unpredictable engineering conditions and unstable ground.

Artificial ground includes:

- Made ground - man-made deposits such as embankments and spoil heaps on the natural ground surface.
- Worked ground - areas where the ground has been cut away such as quarries and road cuttings.
- Infilled ground - areas where the ground has been cut away then wholly or partially backfilled.
- Landscaped ground - areas where the surface has been reshaped.
- Disturbed ground - areas of ill-defined shallow or near surface mineral workings where it is impracticable to map made and worked ground separately.

Mass movement (landslip) deposits on BGS geological maps are primarily superficial deposits that have moved down slope under gravity to form landslips. These affect bedrock, other superficial deposits and artificial ground. The dataset also includes foundered strata, where the ground has collapsed due to subsidence.

Superficial Geology

Superficial Deposits are the youngest geological deposits formed during the most recent period of geological time, the Quaternary, which extends back about 1.8 million years from the present.

They rest on older deposits or rocks referred to as Bedrock. This dataset contains Superficial deposits that are of natural origin and 'in place'. Other superficial strata may be held in the Mass Movement dataset where they have been moved, or in the Artificial Ground dataset where they are of man-made origin.

Most of these Superficial deposits are unconsolidated sediments such as gravel, sand, silt and clay, and onshore they form relatively thin, often discontinuous patches or larger spreads.

Bedrock and Faults

Bedrock geology is a term used for the main mass of rocks forming the Earth and are present everywhere, whether exposed at the surface in outcrops or concealed beneath superficial deposits or water.

The bedrock has formed over vast lengths of geological time ranging from ancient and highly altered rocks of the Proterozoic, some 2500 million years ago, or older, up to the relatively young Pliocene, 1.8 million years ago.

The bedrock geology includes many lithologies, often classified into three types based on origin: igneous, metamorphic and sedimentary.

The BGS Faults and Rock Segments dataset includes geological faults (e.g. normal, thrust), and thin beds mapped as lines (e.g. coal seam, gypsum bed). Some of these are linked to other particular 1:50,000 Geology datasets, for example, coal seams are part of the bedrock sequence, most faults and mineral veins primarily affect the bedrock but cut across the strata and post date its deposition.

Combined Surface Geology

The Combined Surface Geology map combines all the previous maps into one combined geological overview of your site.

Please consult the legends to the previous maps to interpret the Combined "Surface Geology" map.

Additional Information

More information on 1:50,000 Geological mapping and explanations of rock classifications can be found on the BGS website. Using the LEX Codes in this report, further descriptions of rock types can be obtained by interrogating the 'BGS Lexicon of Named Rock Units'. This database can be accessed by following the 'Information and Data' link on the BGS website.

Appendix C Qualitative Risk Assessment Rationale

The site-specific risk assessment, presented in this report, follows the principle of establishing whether there is a viable linkage between a contaminant source to a potential receptor, via an exposure pathway.

The risk assessment corresponds with the total site area and incorporates both descriptive (qualitative) and, where available, numerical (quantitative) lines of evidence.

Risk assessment is the process of collating known information on a hazard or set of hazards to estimate actual or potential risk to receptors. The receptor may be humans, a water resource, a sensitive local ecosystem or future construction materials. Receptors can be connected to the source by one or several exposure pathways such as direct contact for example. Risks are generally managed by isolating the receptor or intercepting the exposure pathway or by isolating or removing the hazard.

Without the three essential components of a source, pathway and receptor there can be no risk. Therefore, the presence of contaminant source on a site does not necessarily mean there is a risk.

The risk assessment considers the likelihood of an event taking place (accounting for the presence of the source and receptor and the viability of the exposure pathway) in conjunction with the severity of the potential consequence (accounting for the potential severity of the hazard and the sensitivity of the receptor).

In the risk assessment, the consequence of the hazard has been classified as severe or medium or mild or minor and the probability (likelihood) of the circumstances occurring classified as high likelihood or likely or low likelihood or unlikely.

The consequences and probabilities are subsequently cross-correlated to give a qualitative estimation of the risk using Department of the Environment risk classifications as detailed in the table below and as referenced in CIRIA C552.

		Consequence			
		Severe	Medium	Mild	Minor
Probability (Likelihood)	High Likelihood	Very High Risk	High Risk	Moderate Risk	Moderate/Low Risk
	Likely	High Risk	Moderate Risk	Moderate/Low Risk	Low Risk
	Low Likelihood	Moderate Risk	Moderate/Low Risk	Low Risk	Very Low Risk
	Unlikely	Moderate/Low Risk	Low Risk	Very Low Risk	Very Low Risk

In accordance with DoE guidance, the following categorisation of **consequence** has been developed.

Classification	Definition	Examples
Severe	Short-term (acute) risk to human health likely to result in "significant harm" as defined by the Environment Protection Act 1990, Part IIA. Short-term risk of pollution of sensitive water resource. Catastrophic damage to buildings/property. A short-term risk to an ecosystem or organisation forming part of such ecosystem.	High concentrations of cyanide on the surface of an informal recreation area. Major spillage of contaminants from site into controlled water. Explosion, causing building collapse (can also equate to a short-term human health risk if buildings are occupied).
Medium	Chronic damage to Human Health. Pollution of sensitive water resources. A significant change in an ecosystem or organism forming part of such ecosystem.	Concentration of a contaminant from site exceeds the generic or site-specific assessment criteria. Leaching of contaminants from a site to a Principal or Secondary A aquifer. Death of a species within a designated nature reserve. Lesser toxic and asphyxiate effects
Mild	Pollution of non-sensitive water resources. Significant damage to crops, buildings, structures and services. Damage to sensitive buildings/structures/services or the environment.	Pollution of non-classified groundwater (inc. Secondary B aquifers). Damage to building rendering it unsafe to occupy (e.g. foundation damage resulting in instability).
Minor	Harm, although not necessarily significant harm, which may result in a financial loss or expenditure to resolve. Non-permanent health effects to human health (easily prevented by means such as personal protective clothing, etc). Easily repairable effects of damage to buildings, structures and services.	The presence of contaminants at such concentrations that protective equipment is required during site works. The loss of plants in a landscaping scheme. Discoloration of concrete.

In accordance with DoE guidance, the following categorisation of **probability** has been developed.

Classification	Definition
High Likelihood	There is a pollution linkage and an event that either appears very likely in the short term and almost inevitable over the long term or there is evidence at the receptor of harm or pollution.
Likely	There is a pollution linkage and all the elements are present and in the right place, which means that it is probable that an event will occur. Circumstances are such that an event is not inevitable, but possible in the short term and likely over the long term.
Low Likelihood	There is a pollution linkage and circumstances are possible under which an event could occur. However, it is by no means certain that even over a longer period such event would take place and is less likely in the shorter term.
Unlikely	There is a pollution linkage, but circumstances are such that it is improbable that an event would occur even in the very long term.

In accordance with DoE guidance, the following categorisation of **risk** has been developed.

Classification	Definition
Very High Risk	There is a <i>high probability</i> that <i>severe harm</i> could arise to a designated receptor from an identified hazard at the site without appropriate further action.
High Risk	<i>Harm is likely to arise</i> to a designated receptor from an identified hazard at the site without appropriate further action.
Moderate Risk	<i>It is possible</i> that without appropriate further action <i>harm could arise</i> to a designated receptor. It is relatively <i>unlikely</i> that any such harm would be <i>severe</i> , and if any harm were to occur it is <i>more likely</i> that such harm would be <i>relatively mild</i> .
Low Risk	<i>It is possible</i> that <i>harm could arise</i> to a designated receptor from an identified hazard. It is <i>likely</i> that, at worst, if any harm was realised any effects would be <i>mild</i> .
Very Low Risk	The presence of an identified hazard does not give rise to the potential to cause harm to a designated receptor.

The term 'risk' in this instance refers to the risk that the source, pathway, receptor linkage for a given source of contamination is complete. It does not refer to immediate risk to individuals or features present on the site from potential contaminants and is intended to be used as a tool to assess the necessity of further investigation.
