Internal Garden
Basement Floor

A proposed installation of an internal garden to be placed on the south elevation of the basement floor. The garden will then flow into one of the Partner's Stands where a potential joint collaboration of both planting and exterior furniture will be exhibited. As illustrated below the gallery space is to the left of this proposed garden where there is an opportunity to celebrate this space. This scheme transfers the sense of an exterior natural environment into the interior, assisting in the mental wellbeing of the inhabitants of the space.

Above the proposed basement garden, against the wall, there is an existing void spanning 780mm by 3250mm and we are proposing either tree to pass through from the basement into the ground floor, utilising this existing double height space.

Ground Floor

At ground floor, the only aspects that are visible from the internal garden will be the tree protruding through the existing void in the floor plate. Surrounding this void will be a frameless, fire regulated glass balustrade, which meets the current handrail Building Regulations of the Approved Document 'K' with a minimum height of 1100mm.

This void space with the proposed tree feeding through is already existing which contributes more to this ideology. Also with the building already incorporating two fire staircases, this allowed us to introduce a similar double height aspect in an open staircase located in the centre, as illustrated below.
