The survey was conducted and this report has been prepared for the private and confidential use of EWC Ltd and cannot be reproduced in whole or in part or relied upon by any third party for any use whatsoever without the express written authorisation of Red Acoustics Limited.

If any third party whatsoever comes into possession of this report, they rely on it at their own risk and Red Acoustics Limited accepts no responsibility (including in negligence) to any such third party.

SUMMARY

Red Acoustics Ltd has been commissioned by EWC Ltd to provide an assessment of the impact of environmental noise on a proposed residential development at Jersey Street, Ancoats.

An environmental noise survey was carried out to determine the existing noise climate from the local road traffic. The survey data has been used to create a 3D noise model so that noise levels can be predicted across the site.

Implementation of the glazing and ventilation strategy to the dwellings identified will ensure that target levels outlined in BS8233:2014 for daytime and a night-time periods in habitable spaces are achieved.

The results of a noise impact study have demonstrated that the future residents will be adequately protected against noise and impact will be at the Lowest Observed Affect Level or less. Therefore, the design of the site and mitigation options comply with National Planning Policy and there should be no constraint to development in relation to noise.

1.0 INTRODUCTION

Red Acoustics Ltd has been commissioned by EWC Ltd to provide an assessment of the impact of environmental noise on a proposed residential development at Jersey Street, Ancoats.

An environmental noise survey was carried out to determine the existing noise climate from the local road traffic.

The environmental noise survey data has been used to create a 3D noise model so that noise levels can be predicted across the site. The predicted levels have then be used in break-in calculations using the methodology in BS8233:2014¹ to determine the level of ingress into the dwellings.

¹ British Standards Institute 8233:2014 *Guidance on sound insulation and noise reduction for buildings*

2.0 SITE DESCRIPTION & PROPOSED DEVELOPMENT

The proposed development site is the former New Little mill, Jersey Street, Ancoats. To the North of the site is Jersey St, with residential dwellings, to the South is Waulk Mill and Redhill St . To the East is Radium St, & the Bengal St, ad residential dwellings borders the site to the West.

The proposed development is for the redevelopment of the New Little Mill in to residential dwellings comprising of 1 and 2 bedroom flats for open market sale. The site location is presented in Figure 2.1 below. The major source of environmental noise across the site is road traffic noise from the Jersey St and quieter side streets including Radium Street.

Figure 2.1: Proposed Site Location Plan

3.0 PLANNING POLICY & DESIGN TARGETS

Planning Policy

National Planning Practice is guided by the National Planning Policy Framework. With regard to Noise the Framework states the following:

Planning policies and decisions should take account of the acoustic environment and consider:

- *whether or not a significant adverse effect is occurring or likely to occur;*
- *whether or not an adverse effect is occurring or likely to occur and;*
- *whether or not a good standard of amenity can be achieved.*

In line with the Explanatory Note of the Noise Policy Statement for England, this would include identifying whether the overall effect of the noise exposure (including the impact during the construction phase wherever applicable) is, or would be, above or below the significant observed adverse effect level and the lowest observed adverse effect level for the given situation.

The terms 'significant adverse impact' and 'other adverse impacts' are defined in the explanatory notes of the 'Noise Policy Statement for England (NPSE)' which states:

There are two established concepts from toxicology that are currently being applied to noise impacts, for example, by the World Health Organisation. They are:

No Observed Effect Level : This is the level below which no effect can be detected. In simple terms, below this level, there is no detectable effect on health and quality of life due to the noise.

Lowest Observed Adverse Effect Level : This is the level above which adverse effects on health and quality of life can be detected.

Extending these concepts for the purpose of this NPSE leads to the concept of a significant observed adverse effect level.

Significant Observed Adverse Effect Level : This is the level above which significant adverse effects on health and quality of life occur.

These are summarised in Table 3.1 below.

Table 3.1: Explanation of Noise Exposure Hierarchy

Perception	Examples of Outcomes	Increasing Effect Levels	Action
Not noticeable	No Effect	No Observed Effect	No specific measures required
Noticeable and not intrusive	Noise can be heard, but does not cause any change in behaviour or attitude. Can slightly affect the acoustic character of the area but not such that there is a perceived change in the quality of life.	No Observed Adverse Effect	No specific measures required
		Lowest Observed Adverse Effect Level	
Noticeable and intrusive	Noise can be heard and causes small changes in behaviour and/or attitude, e.g. turning up volume of television; speaking more loudly; closing windows for some of the time because of the noise. Potential for non-awakening sleep disturbance. Affects the acoustic character of the area such that there is a perceived change in the quality of life.	Observed Adverse Effect	Mitigate and reduce to a minimum
		Significant Observed Adverse Effect Level	
Noticeable and disruptive	The noise causes a material change in behaviour and/or attitude, e.g. having to keep windows closed most of the time, avoiding certain activities during periods of intrusion. Potential for sleep disturbance resulting in difficulty in getting to sleep, premature awakening and difficulty in getting back to sleep. Quality of life diminished due to change in acoustic character of the area.	Significant Observed Adverse Effect	Avoid
Noticeable and very disruptive	Extensive and regular changes in behaviour and/or an inability to mitigate effect of noise leading to psychological stress or physiological effects, e.g. regular sleep deprivation/awakening; loss of appetite, significant, medically definable harm, e.g. auditory and non-auditory	Unacceptable Adverse Effect	Prevent

It should be noted that no specific noise limits for NPPG have been defined in Table 3.1 above, however, guidance from other acoustic standards may be employed to determine suitable levels within the overall principal of the National Planning Policy Framework.

The overarching policy guidance in the UK is BS8233:2014. This standard defines internal and external noise levels which, if achieved, will ensure a good standard of residential amenity and can be considered to be commensurate with the **Lowest Observed Adverse Effect Level**.

The targets described in BS8233:2014 are presented in Table 3.2. These targets also comply with the Manchester City Council Planning & Noise document.

Table 3.2: BS8233:2014 Design Targets

Space	L _{Aeq,16hr} (07:00 - 23:00)	L _{Aeq,8hr} (23:00 - 07:00)	L _{Amax}
Living Room & Kitchen	35dB	-	-
Bedroom	35dB	30dB	≤45dB

For traditional external areas that are used for amenity space, such as gardens and patios, it is desirable that the external noise level does not exceed 50 dB L_{Aeq,T}, with an upper guideline value of 55 dB L_{Aeq,T} which would be acceptable in noisier environments.

However, it is also recognised that these guideline values are not achievable in all circumstances where development might be desirable. In higher noise areas, such as city centres or urban areas adjoining the strategic transport network, a compromise between elevated noise levels and other factors, such as the convenience of living in these locations or making efficient use of land resources to ensure development needs can be met, might be warranted.

In such a situation, development should be designed to achieve the lowest practicable levels in these external amenity spaces, but should not be prohibited.

4.0 ENVIRONMENTAL NOISE SURVEYS

An unattended noise survey has been undertaken to measure existing noise levels from the surrounding local roads on the 28th September - 2nd October 2018. Tables 4.1 present the summary results for MP1, MP2 and MP3. Full details and survey results are provided in Appendix B.

Figure 4.1: Noise Measurement Positions

Table 4.1: Summary Noise Survey Results

Position	Date	Start Time	Finish Time	L _{Aeq,5min} dB	L _{AFmax} dB
MP1	28/09/2018	11:57	23:00	49.6-78.8	68.8-102.9
	28/09/2018	23:00	07:00	40.2-59.7	44.7-80.3

	01/10/2018	23:00	07:00	44.5-59.4	54.5-74.2
	02/10/2018	07:00	16:10	57.8-71	66.7-93.6

*High levels due to construction noise

5.0 NOISE MODELLING AND BREAK-IN ASSESSMENT

Noise Modelling

To predict noise levels across the site, CadnaA 3D software has been used, which implements the calculation procedure specified within ISO9613-2.

The model has utilised topography data from the Environment Agency, drawings provided by the architect and is based on the measured environmental noise survey data. We have assumed that the levels on the proposed site are congruent with those already in existence across the site.

Based on our analysis of the noise survey results, the source noise levels in Table 5.1 below have been used to calibrate the noise model. Appendix A provides the results of the noise model including the noise model calibration.

Table 5.1: Model Source Sound Power Levels dB

Source	Scenario	Octave Band Sound Power Level dB					dB (A)
		125Hz	250Hz	500Hz	1kHz	2kHz	
MP1	Daytime $L_{Aeq,t}$	55.9	54.8	54	54.9	46.5	57.3
	Night-time L_{Amax}	66.6	66.8	67	68.2	59	70
	Night-time $L_{Aeq,t}$	56.5	56.1	55.5	55.5	50.9	59
MP3	Daytime $L_{Aeq,t}$	59	56.4	54.1	56.5	48.1	58.7
	Night-time L_{Amax}	64.6	63.7	60.7	62.6	54	64.6
	Night-time $L_{Aeq,t}$	54.3	51.9	50.1	54	46.5	55.9

Buildings in the model have been set to reflective, ground absorption has been changed to 0.8 to account for rough/mixed ground. Two orders of reflection have been set in the model.

BS8233:2014 Break-in Assessment

Sound insulation calculations have been undertaken in accordance with the methodology prescribed in BS8233:2014. We have undertaken calculations for typical living room and kitchens spaces as well as a worst case typical bedroom space based on broadband noise levels impacting the site.

6.0 DESIGN GUIDANCE

The specification for facade sound insulation for all living rooms, kitchens and bedroom spaces is shown below in Table 6.1. Appendix A presents the mapped result showing the dwellings where vents with the proposed acoustic performance are required.

Table 6.1: Facade Element Performance Used in Break-in Calculations

Facade Element	Rw+Ctr	Octave Band Performance Data dB				
		125	250	500	1000	2000
4/16/4 Glazing (SRI)	25	21.0	17.0	25.0	35.0	37.0
8/6/4 Glazing (SRI)	29	22.0	21.0	28.0	38.0	34.0
6.8/16/6.8 (SRI)	37	23.0	26.0	35.0	43.0	48.0
External Wall (R)*	49	35.0	47.0	63.0	74.0	84.0
External Wall (R)**	55	40.0	60.0	74.0	86.0	92.0

The calculations assume that the window is closed and background ventilation is provided by mechanical ventilation capable of supplying air to the required rate by Approved Document F. External wall construction to Levels 00 & 04 consists of the following build up:

- 325mm Brick + 15mm Cavity + 2x12.5mm Wall Board.*

External wall construction to Levels 05 & 06 comprises the following build up:

- 1x12.5mm Siniat Weather Defence + 38mm Steel Frame + 150mm Cavity +150mm Insulation +1x15mm Siniat GTEC Fire Board + 90mm Steel Stud + 215mm Cavity + 100mm Insulation +1x15mm Siniat GTEC Standard Board.**

Purge ventilation can be managed with short term openable windows on plots that require background ventilators. However, opening windows will reduce the sound insulation of the facade and internal noise levels will, in the short term, increase when the window is open.

The report submitted by Arup, reference 235055-R002-STJ sets out a plan for a glazing a ventilation strategy, for the re-development of the New Little Mill, Ancoats, Manchester. Red acoustics Ltd has been commissioned to review the initial strategy and provide an updated and informed revision. This report shows that there is a variation from the initial Arup specification. Break-In calculations are available upon request.

7.0 CONCLUSIONS

An assessment of the suitability of the Jersey St, Ancoats site for residential development has been undertaken.

Based on the proposed site layout, topography and noise survey data, external noise levels have been predicted and compared with the requirements of BS8233:2014 and Local Authority criteria.

Internal noise levels can easily be achieved with the use of an approved glazing and ventilation mitigation strategy. Implementation of the recommended glazing and ventilation strategy will ensure that the requirements of BS8233:2014 will be met.

This report has presented the results of a noise impact study together with recommendations for protecting future residents. It has been demonstrated that the future residents will be adequately protected and that the impact to future residents will be at the Lowest Observed Affect Level or less for the majority of the time.

APPENDIX B: NOISE SURVEY DETAILS

Location

Jersey Street, Ancoats, Manchester

Survey Dates

28th September - 2nd October 2018

Weather

Weather during the surveys was cool, and typically dry with wind speeds $<5\text{ms}^{-1}$

Personnel

Simon Webster BEng. (Hons) MIOA (Setup & Collection)

Instrumentation

Table C1 below presents the instrumentation used during the surveys.

Methodology

Before and after the measurements the sound level meters were check calibrated to an accuracy of $\pm 0.3\text{dB}$ using their associated Class 1 Calibrators. No drift in the instruments' sensitivities were noted across any of the survey periods.

Calibration Certificates

Copies of all calibration certificates are kept on file by Red Acoustics Ltd and can be supplied if requested.

Table C1: Instrumentation
