Planning Guidance: Contamination Statement
Does the site described herein involve any of the following:
a. Land which is known to be contaminated? **No**
b. Land where contamination is suspected for all or part of the site? **Yes**
c. A proposed use that would be particularly vulnerable to the presence of contamination? **No**

1.0 Introduction

1.1 Brief

In March 2016 Curtins were instructed by Allied London to undertake a Phase 1 Desk Top Study at a site of London Road Fire Station, London Road, Manchester (M1). The project is split into two phases; Phase 1 involves the repair of the existing structure to create shell space for letting out, and Phase 2 involves new works by the client. The proposed development plans are included within Appendix A1.

The site is centred on National Grid Reference, 384670, 397820, with an approximate area of 0.62ha. A location plan is presented below in Section 2.1.

As noted, the Phase 1 Preliminary Site Assessment has been undertaken in support of the re-development of the site as mixed retail/restaurant/hotel and residential.

1.2 Scope

The Phase 1 is intended to provide an overview of the geo-environmental and geo-technical setting of the site of interest.

Through this overview the Phase 1 aims to develop both a working conceptual and ground model for the site, as well as present an initial assessment of any risks that could be presented to the development including its intended end users and the wider environment.

Specifically, the Phase 1 provides an initial assessment of the site with regard to:

a) Potential contamination of the site strata by historical and or current use.
b) The potential impact on the wider environment by historical and or current use of the site of interest.
c) The potential impact from surrounding land uses and other environmental factors.
d) Potential problems associated with geological features such as faulting, mineral extraction, mining and land instability.
e) The location of apparent sub-surface structures that may affect the proposed redevelopment.
f) The location of above-surface features that may affect the proposed redevelopment.

The Phase 1 is desk based with a preliminary ground investigation having been undertaken at the site. An additional aim of this report is to establish the requirement for, and extent of, further ground investigation work to be completed at the site, in advance of any development works taking place.

2.0 Desk Study

In accordance with the scope identified in Section 1.1, this desk study has been undertaken using the following data sources.

- Envirocheck Report, 2016
- British Geological Society records, accessed 2016
- Environment Agency website, accessed 2016
- Coal Authority website, accessed 2016
- University of Manchester Image Collection – Manchester Bomb Damage
- Zetica Regionally Unexploded Bomb Risk, Manchester
- Radon Atlas for England and Wales

2.1 Current Setting

The London Road Fire Station site is located within the city centre region of Manchester; the site is situated approximately 30m west of Manchester Piccadilly Station. A site location plan is presented on the following page (Figure 2.1).

The site is bound by Whitworth Street (A6) to the north, London Road to the east, Fairfield Street to the south and Minshull Street South to the west. Manchester Piccadilly Station and associated infrastructure are located to the east. Manchester Metropolitan University is located approximately 60m west and the University of Manchester is located 60m to the approximate south.

The current surrounding land use comprises mixed commercial, industrial, residential, leisure and transport.

The site currently incorporates London Road Fire Station; a historical fire station currently in disuse. The location is noted as a Grade II* Listed Building. Previously associated uses include; a fire station, ambulance station, police station, gas-meter testing station, coroner's court and bank. The building is situated around a number of local road networks and maintains a large courtyard in the centre of the site. Completed in 1906, the building incorporates a large tower at the southern flank.

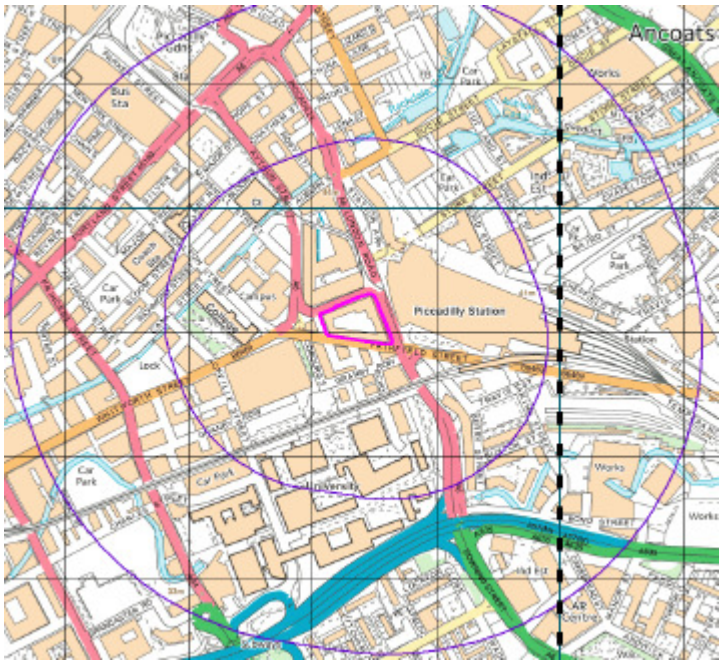

Figure 2.1 *Site location plan. Development site boundary identified in pink. Centre of site located at National Grid Reference: 384670, 397820*

2.2 Previous Site Uses

A review of the available historical mapping information for the site (as presented within the Envirocheck report (Ref.1) has been undertaken and is presented in Table 2.2 below. Potential sources are not repeated where the same in succeeding years.

Table 2.2 *Previous Site Uses and Potential Sources of Contamination*

Date	Description	Potential Sources of Contamination
1850s-1890s	The site incorporates a number of high density terrace structures and associated grounds. The site is bound by and intersected by a number of roads.	• Limited potential for contamination • Potential of ash and clinker deposition associated with coal fire use during this period.
1908	The high density terrace buildings, noted within the previous evaluation, have been removed. A single structure maintains the majority of the site which is bound by adjacent roads. The building is noted as a Chief Fire Engine Station which includes a large, unlabelled, courtyard in the centre of the complex.	• Uncontrolled deposition of Made Ground from unknown sources associated with the removal of old structures and site development • Localised fuel/oil/chemical spillages from engines and associated equipment • Localised spillages from industry related products

Date	Description	Potential Sources of Contamination
1922	The site building remains unchanged in structure; evidence of building being sub-divided to maintain a multi-use location. A police station and ambulance station is noted across the western boundary of the site. A gas meter test station is noted across the northern boundary of the site. A coroner's court and bank are noted across the eastern boundary of the site. The rest of the site comprises the fire station and associated yard. A telephone call box is noted across the northern boundary. A lamp house is noted across the eastern boundary.	• Localised spillages from associated vehicles and equipment from multiple industries
1940s	Evidence of an additional building constructed across the south-eastern proportion of the central yard (noted as control room). The site is subdivided and incorporates a number of rooms and storage areas; of note storage facilities, offices, police cells, meter testing and lost property office, dwellings, bank, electrical operations, hose tower and drying facilities. A chimney is located at the west of the site	• Contamination arising from construction on site • Spillages arising from use and storage and vehicles and equipment • Risk of asbestos inclusion in new building development • Potential for ash and clinker deposition from coal combustion onsite
1951-1951	Ambulance station and gas meter test station no longer represented onsite. Electricity pillars or electricity poles ate noted across the eastern boundary of the site.	
1962	A number of locations across the site include a varied use from previous assessments. The control room is now noted as a garage. A paint shop, smithies and motor repairs are noted across the northern boundary of the building. A large electrical equipment storage room is noted. An additional motor repairs workshop is located in the north western corner of the site.	• Localised fuel/oil/chemical spillages from engines and associated equipment • Localised spillages from industry related products • Risk of chemical contamination from paint operations and other industries • Storage and use of fuels on site for motor plant & machinery.
1992	Demolition of additional building within the south-eastern proportion of the central yard	• Contamination associated demolition • Possibility of Made Ground onsite

Potential sources of on-site contamination are further discussed in Section 3.0.

2.3 Immediate and Surrounding Land Uses

A review of the available historical mapping information for the immediate surrounding (<100m distance) and surrounding (>100m distance) areas (as presented within the Envirocheck report (Ref. 1) has been undertaken with specific reference to potential sources of contamination the findings of which are detailed in Table 2.3 below. Potential sources are not repeated where the same in succeeding years.

Table 2.3 *Land Uses in Immediate and Surrounding Areas and Potential Sources of Contamination*

Date	Description	Potential Sources of Contamination
1851	The area adjacent to the site incorporates high density terrace buildings, a large cotton mill is located 25m west London Road Station, and associated infrastructure, is located approximately 40m north-east of the site. Railway stores located 60m north-east A cotton mill is located 50m north Notable railway line located 90m south Evidence of additional works surrounding the site A number of wharfs are located west of the site	• Localised fuel/oil spillages from engine shed & locomotives • Clinker and ash development from residential and works coal combustion • Contaminants arising from surrounding industries • Contamination arising from train use, coal combustion and equipment storage • Made Ground
1891	Notable expansion of London Road Station to the east of the site A chemical works is located approximately 275m south-east	• Contamination arising from train use, coal combustion and equipment storage • Made Ground • Contamination arising from adjacent construction
1893	A mill is located 100m north An iron works, cotton mill and boiler works are located 120m-200m south of the site A number of cotton mills and works are noted approximately 250m south-east Central Train Station is located 900m west	• Contamination from industry related combustion of coal and fossil fuels • Contamination arising from vehicles and equipment associated with industries • Chemical contaminates associated with industries
1894-1896	Wharf noted 75m east of the site River running approximately 175m south of the site (at closest point) A printing works is located 850m east Canal system located across region High density urban distribution across the region A large gas works is located 1000m south-west	• Contaminants arising from local industries and chemical incorporation • Coal and fossil fuel combustion
Early 1900's	A tramway is situated adjacent to the site across the southern boundary Evidence of demolition across the region; notable removal of high density terrace housing 25m south of the site; area has been redeveloped and incorporates a number of large buildings An infirmary is located 250m to the north-west Development of Mayfield Station 250m east Development of an engineering works located 125m south-east of the site Building demolition 50m north-west of the site Building demolition 250m north-east of the site	• Contamination from adjacent tramway system • Made Ground from regional demolition and redevelopment • Contamination arising from building construction
1942	A number of buildings are noted adjacent to the southern boundary of the site associated with various industries and uses noted as; electric lamps, costume factors, textile factory and cotton works. Beyond this a hotel, bakery, printer, battery repair and electrics works, a disused petrol tank, a sunk petrol tank, and others. A smithy, engineering works and sub-station are located beyond this (amongst others). A dye house and municipal college of technology is located to the west No information provided to the east	• Leakage of petrol storage tanks • Leakage and spills associated with adjacent industries • Incorporated chemicals associated with adjacent industries

Date	Description	Potential Sources of Contamination
Mid-1900's	Wharf's no longer noted to the west of the site Car park facilities located 200m north-west A number of warehouses located adjacent to the site across the northern boundary Rochdale Canal noted 175m north Notable reduction in Mayfield Station	• Hydrocarbon contamination from cars and vehicles • Made Ground associated with demolition • Hydrocarbon contamination associated with vehicle parking
1962	Evidence of additional or varied industries noted south of the site including an additional sunk petrol tank (disused). Notable demolition 50m south and 50m west of the site Notable demolition approximately 100m south-west	• Made Ground from demolition and building development • Leakage of petrol storage tanks
Late-1900's	Evidence of wider urban development across the region; progression of demolition and redevelopment particularly 125m northeast and 200m northwest. Establishment of depot 300m north-east of site Development of subway approximately 300m south of the site Development of University complex from 200m south of the site Hoyle Street Industrial Estate noted 500m south-east, replacing historical works. Introduction of canal basin 750m north-east TA centre noted 600m south-east University located 75m west of the site	• Made Ground from demolition and building development • Localised fuel/oil/chemical spillages • Possible use and storage of known substances within University • Use of unknown materials and equipment at TA centre • Contamination from unknown works across the region
2016	Evidence of a highly urbanised location Evidence of numerous vehicle and transportation links across the region High density building structures University buildings located to the south of the site	• Localised fuel/oil spillages associated with haulage vehicles/motor dealers • Contamination arising from urbanised landscape

Potential sources of off-site contamination are further discussed in Section 3.0.

2.4 Geology

A study of the Envirocheck report (Ref.1) and British Geological Survey (BGS) 1:50,000 mapping records (Bedrock and Superficial Editions), Sheet No.085 for Manchester (Ref.2) and BGS interactive Geology Map (Ref.3) indicates the following geological succession underlying the site.

- Made Ground (Undivided)
- Till, Devensian (Diamicton)
- Chester Pebble Beds Formation - Sandstone

A number of BGS historical borehole records (Ref.3) are available associated with the wider region, the closest, located approximately 8m north of the building boundary (ID: SJ89NW1 at grid location 384628, 397838) was terminated at a depth of 9.14m bgl. Average made ground depth in this area has been recorded as between 3.35m and 8.84m bgl, with Devensian Till absent in some locations. Bedrock was encountered at depths of between 8.84m and 10.06m bgl.

No fault lines are noted intersecting the site however five faults are situated within 1000m of the site.

2.4.1 Mining

The Envirocheck Report (Ref.1) confirms that the site is situated within an area which may be affected by coal mining. The Coal Authority's online interactive mapping (Ref.5) suggests a number of mine entry locations to the east however these are noted outside the 1000m site buffer. The tool outlines the presence of a development high risk area approximately 600m east of the site. No evidence of mining was noted within the historical mapping within the site, or the area immediately surrounding the site.

Based on the foregoing commentary the likelihood of encountering relic mining features on site is considered to be unlikely and therefore has not been considered further.

2.4.2 Other Ground Stability Hazards

The Envirocheck report (Ref.1) confirms that there is a very low risk to no hazard from the following ground stability hazards on and around the site; running sands, collapsible, landslides shrinking or swelling clay, compressible ground and ground dissolution.

2.4.3 Radon

The BGS Radon Mapping (Ref.1) confirms part of the site is situated in a low probability radon area as less than 1% of homes are above the action level. On this basis, radon protection measures are not considered necessary within the proposed development and have not been considered further.

2.5 Hydrogeology

The Groundwater Vulnerability Map presented within the Envirocheck report (Ref.1) indicates that the site is underlain by a Principal Aquifer situated within the bedrock. Principal Aquifers are defined as layers of rock or drift deposits that have a high intergranular and/or fracture permeability meaning they usually provide a high level of water storage. They may support water supply and/or river base flow on a strategic scale. In most cases, principal aquifers are aquifers previously designated as major aquifers.

Furthermore, the southern proportion of the site is located within a Secondary Undifferentiated Aquifer within the superficial deposits. Secondary Undifferentiated Aquifers are that that have been assigned in cases where it is not possible to attribute either category A or B to a rock type. In most cases, this means that the layer in question has previously been designated as both minor and non-aquifer in different locations due to the variable characteristics of the rock type.

The site is not located within a Source Protection Zone. A Total Catchment Zone III is located within 1000m of the site location; situated approximately 689m south-west at the closest location.

The Envirocheck Report (Ref.1) notes low permeability drift deposits occurring at the surface and overlying Major and Minor Aquifers are head, clay-with-flints, brickenearth, peat, river terrace deposits and marine and estuarine deposits.

There are two groundwater abstractions recorded within 500m of the site. The abstractions, recorded 252m west of the site location, are described within a Borehole at Origin Development and operated by West Contracting. The Envirocheck report identifies the groundwater abstraction purpose is for other/industrial/commercial/public services: non-evaporative cooling, with a permit start date of January 2009 (end date is not supplied). The wider region incorporates a number of other groundwater abstraction points within 1000m of the site, with one at 834m southwest of the site used for general use at a Manchester Metropolitan University.

2.6 Hydrology

The nearest identified surface water feature is located approximately 41m to the north-west of the site.

There are no surface water abstractions recorded within 1000m of the site.

There are no discharge consents, Local Authority Pollution Prevention and Controls permits or pollution incidents to Water Environment arising from the site.

There are a number of discharge consents arsing within 1000m of the site; the closest, located 53m north-west, is situated at Minshull Street/Whitworth Street (Manchester). The property type is noted as sewage works (sewers – Water Company) with a discharge type of public sewage (storm sewage overflow).

There are a number of Local Authority Pollution Prevention and Controls located within 1000m of the site; the closest, located 310m north-east, is situated at Chapeltown Street (Manchester). The process type is noted as local authority air pollution control with an authorisation revoked status. The site is associated with Central Taxi Spares Ltd.

There are a number of Pollution Incidents to Controlled Waters noted within 1000m of the site, the closest, located 39m north, is situated at an unknown position. The property type, defined as private sewage (Non-PLC) sewage systems, maintains an incident date March 1991.

A single Pollution Prevention and Control Enforcement is noted 222m north-east of the site; the location is associated with an air pollution control enforcement notice and is dated November 1998.

The site is not situated in an area that is known to be at risk from extreme flooding or flooding from rivers or sea. A number of locations across the centre and the southern boundary of the site are suggested as being of low risk (1000 year return period) to flooding from surface water. The northern

boundary of the site appears in a location which may be susceptible to high (30 year return period), medium (100 year return period) and low (1000 year return period) Surface water flooding.

2.7 Landfill

According to the Envirocheck report (Ref.1) there are no recorded historic or currently operational landfills on site or within 250m of the site. The nearest historical site is located 937m east while the nearest registered site is located 971m east.

The nearest licensed waste management facility to the site is a metal recycling site (mixed) (operated by Donnelley Mr. A, issued October 1996), located approximately 550m south-east of site at 2 Hoyle Street, Manchester. The licence is noted as suspended.

There are a number of locations of potentially infilled land within 1000m of the site location; the nearest, located 45m west of the site is described as unknown filled ground (pond, marsh, river, stream, dock etc.) dated 1956.

The nearest registered waste transfer site is located 874m east while the nearest waste transfer or disposal site is located 578m east.

2.8 Unexploded Ordnance (UXO)

Military activities including those conducted as part of both the First and Second World Wars have resulted in a legacy of unexploded ordnance (UXO) being present within the shallow soils of the UK.

UXO result from various sources including both allied (military training) and German (bombing raids) with a guide figure of approximately 10% of all munitions failing to function as designed.

The likelihood of UXO being encountered on a development site is influenced by a number of factors including; the proximity to strategic targets, the nature of the development works being undertaken and evidence of local damage in the post-war periods amongst others. In order to determine the likelihood of UXO being present on a site, a step-wise risk assessment process is followed. This process is outlined within CIRIA C681 *Unexploded Ordnance: A Guide for the Construction Industry* with the following commentary considered to represent a Preliminary Risk Assessment intended to guide if and where there is a requirement for a Detailed Risk Assessment.

During WWII, the site was located in an area of moderate bombing density, as confirmed by official statistics and mapping. UXO risk mapping (Ref.6) indicates the site to be in close proximity to areas of Manchester suggested as being of high risk and locations of >1000 bomb tonnage.

Analysis of known bomb drop locations, presented during war years, indicates that a number of positions in close proximity to the sites western boundary were affected (Ref.4). As such, it stands to reason that UXO existence may be prevalent in locations which were known to be affected by bombing activity during this period.

The nature of the ambient land use; incorporating works, engineering works, emergency service facilities and train stations, suggests the possibility to targeted bombing raids across the region thereby accounting for previously suggested damage and, with regards to future works, the possibility of UXO presence across the region. Limited development across the site during post-war years may suggest limited chance for UXO disturbance or discovery.

The factors determining the likelihood of First World War UXO being present on site are analogous to those guiding the likelihood Second World War UXO being present with less likelihood given the far fewer numbers of bombs dropped during this war.

The exact nature of the site geology (Till) is not known however is considered likely to comprise fine grained (clay) soils resulting in a large range of potential UXO penetration depths from around 0.50m up to 14.00m below ground level.

At this stage the proposed development works are likely to entail; ground investigations, shallow excavations for earthworks and the emplacement of spread foundations (subject to ground conditions revealed) with localised deep excavations possible, e.g. drainage alignments. In general, the shallow nature or very small footprint (boreholes) of these activities will further reduce the likelihood of UXO being encountered. The consequence of a UXO strike is invariably severe.

Based on the foregoing commentary therefore it is considered to be a low likelihood of UXO being encountered on site as part of the ground investigation or development works. Notwithstanding, procurement of a Detailed Unexploded Ordnance report is recommended prior to development works commencing.

2.9 Significant Features Potentially Affecting Re-development

The site maintains the presence of a Grade II* Listed Building.

2.10 Existing Reports

No existing reports, specific to the subject site, have been made available for review at this stage.

3.0 Conceptual Site Model & Qualitative Risk Assessment

The conceptual site model (CSM) and Qualitative Risk Assessment (QRA) are presented in the table presented in this section. A diagrammatic CSM is contained within Appendix A1.

The CSM details the source-pathway-receptor linkages or potential pollutant linkages (PPL) that have been identified for the site. The QRA details the associated level of risk relating to these potential pollutant linkages.

The CSM and QRA concern risk to human health and water environment with additional, more specific risk assessment protocols contained within the main body of this reporting, as detailed in Section 3.1 below.

The QRA follows the framework outlined within CIRIA C552 which is summarised within Appendix A4.

The 'risk rating' within the QRA refers to the risk that the source, pathway, receptor linkage or PPL is complete. Unless specifically stated it does not necessarily refer to an immediate risk and is intended to be used as a tool to assess the necessity for further assessment/investigation.

3.1 Additional Risk Assessments

The following risk assessments, listed below, are not included within the main CSM and QRA but none-the-less can be of critical importance to the onward development of the site.

- The risk presented by Mining is discussed and assessed in Section 2.4.
- The risk presented by Radon is discussed and assessed in Section 2.4.
- The risk presented by Unexploded Ordnance is discussed and assessed in Section 2.8.

Under current health and safety legislation, employers are required to carry out their own appropriate risk assessments and mitigation to protect themselves and their employees, other human receptors and the environment from potential contamination. Such risks must be adequately mitigated by law, specifically the Construction Design Management (CDM) Regulations, 2015 which require that potential risks to human health and the environment from construction activities are appropriately identified and all necessary steps taken to eliminate / manage that risk. It has been assumed that any future construction works on site will be undertaken in compliance with these requirements and therefore construction workers involved in the building works at the site have been discounted as a human receptor in the conceptual site model.

Qualitative Risk Assessment → Generic Quantitative Risk Assessment → Detailed Quantitative Risk Assessment or; Remedial Action

- The table below represents the first stage in the land quality risk assessment process; the Qualitative Risk Assessment.
- In order for a development site to be deemed 'suitable for use' the level of risk needs to be brought down to acceptable levels, i.e. low to negligible risk. The purpose of each stage of risk assessment is ultimately to establish if there is a requirement for additional levels of assessment to be made in order to have sufficient confidence to support a risk characterisation or management decision, e.g. remedial action.
- In the absence of specific site data a Generic Quantitative Risk Assessment is invariably recommended.

Conceptual Site Model			Qualitative Risk Assessment			Action
Source	**Pathway(s)**	**Receptor(s)**	**Consequence (Potential Severity)**	**Likelihood of Occurrence**	**Risk Rating**	
On-Site Sources of Potential Contamination • Potential of ash and clinker deposition associated with coal combustion • Uncontrolled deposition of Made Ground from unknown sources associated with the removal of old structures and site development • Localised fuel/oil/chemical spillages from engines and associated equipment • Localised spillages from industry related products • Localised spillages from associated vehicles and equipment from multiple industries • Contamination arising from construction processes • Risk of chemical contamination from paint operations and other industries • Storage and use of fuels on site for motor plant and machinery • Contamination associated with demolition • Risk of asbestos inclusion in new building development *Potential contaminants of concern associated with the above sources include, amongst others; hydrocarbons including diesel/petrol range organics from fuel spillages, polycyclic aromatic hydrocarbons arising from incomplete combustion, PCB (Polychlorinated biphenyl) and hydrocarbons associated with substation and inorganic compounds including metals, non-metals and asbestos.*	**Direct contact, ingestion, inhalation (dust and vapours)**	**End user of site** Employees, general public, construction works, site visitors	**Medium** Chronic health risk	**Likely** Historical use of the site has incorporated a region of high density terrace buildings followed by a period of demolition and subsequent construction of a fire station. The complex was utilised by a number of additional industries and included one, known, period of redevelopment. The site housed a number of technical/industrial/works based uses including motor works and paint works. Evidence suggested within the Envirocheck Report (Ref.1) indicates a high probability of Made Ground across the site and winder region.	**Moderate**	**Generic Quantitative Risk Assessment** Recommended as part of the ground investigation.
	Vertical migration through the superficial deposits (soils) May occur due to existing service corridors and physical processes including; capillary action, burrowing animals inducing soil mixing and downwards into the natural deposits through infiltration.	**Water Environment** Principal Aquifer There are two groundwater abstraction records situated within 500m of the site. The site is not within an area designated a Source protection Zone.	**Medium** Pollution of non-sensitive water resources	**Likely** If and where contamination is present on site it is likely to be either; present as minor inclusions at relatively low concentrations that, on the balance of probability is unlikely to necessitate remedial action or else, bound in construction materials, e.g. road construction. Notwithstanding, localised areas of higher concentrations cannot be ruled out. Historic borehole logs for the site and local area record made ground directly overlying sandstone bedrock (Principal Aquifer)	**Moderate**	**Generic Quantitative Risk Assessment** Recommended as part of the ground investigation.
	Horizontal migration over and through the superficial deposits (soils) May occur due to the influence of perched or natural groundwater flow patterns and natural or man-made high permeability zones, e.g. sand lenses or drainage runs.	**Water Environment** There is a surface water feature noted 41m north-west of the site	**Medium** Pollution of non-sensitive water resources	**Low Likelihood** If and where contamination is present on site it is likely to be either; present as minor inclusions at relatively low concentrations that, on the balance of probability is unlikely to necessitate remedial action or else, bound in construction materials, e.g. road construction. Notwithstanding, localised areas of higher concentrations cannot be ruled out. The surface water feature is located in close proximity but does not appear large enough to be portrayed within the resources	**Moderate/Low**	**Generic Quantitative Risk Assessment** Recommended as part of the ground investigation.

Conceptual Site Model			Qualitative Risk Assessment			Action
Source	**Pathway(s)**	**Receptor(s)**	**Consequence (Potential Severity)**	**Likelihood of Occurrence**	**Risk Rating**	
Off-site sources of potential contamination: Historical and present uses of the surrounding area may provide contamination sources including; • *Localised fuel/oil spillages from engine shed and locomotives* • *Clinker and ash development from residential and works coal combustion* • *Contaminants arising from surrounding industries* • *Uncontrolled deposition of Made Ground from unknown sources associated with the removal of old structures and site development* • *Contamination arising from adjacent construction* • *Contamination arising from vehicles and equipment associated with industries* • *Chemical contaminants associated with industries* • *Contamination from adjacent tramway system* • *Leakage of petrol storage tanks* • *Hydrocarbon contamination associated with vehicle parking* *Potential contaminants of concern associated with the above sources include, amongst others; hydrocarbons including diesel/petrol range organics from fuel spillages, polycyclic aromatic hydrocarbons arising from incomplete combustion, PCB (Polychlorinated biphenyl) and hydrocarbons associated with substation and inorganic compounds including metals, non-metals and asbestos.*	**Horizontal migration through the superficial deposits and air (dust/particulates)** Followed by… **Direct contact, ingestion, inhalation (dust and vapours)**	**End user of site** Employees, general public, construction works, site visitors	**Medium** Chronic health risk	**Unlikely** The notable presence of Till deposits indicates that if and where contamination does exist it is likely to be well contained in these off-site locations under hardcover and through the anticipated low permeability of the underlying soils.	**Low**	**No further action recommended**
	Horizontal migration through the superficial and bedrock deposits	**Water Environment** Principal Aquifer There are two groundwater abstraction records situated within 500m of the site. The site is not within an area designated a Source protection Zone	**Mild** Pollution of non-sensitive water resources	**Unlikely** The notable presence of Till deposits indicates that if and where contamination does exist it is likely to be well contained in these off-site locations under hardcover and through the anticipated low permeability of the underlying soils.	**Low**	**No further action recommended**

Conceptual Site Model			Qualitative Risk Assessment			Action
Source	**Pathway(s)**	**Receptor(s)**	**Consequence (Potential Severity)**	**Likelihood of Occurrence**	**Risk Rating**	
On and off-site soils with the potential to generate ground gases Made ground is suggested as a possible feature within the Envirocheck Report. Evidence of site redevelopment and possible modification to sub-surface material. No significant off-site sources of ground gas are noted.	**Vertical and horizontal migration through existing service corridors and the underlying superficial deposits**	**End user of site** Residents, general public, construction works, site visitors	**Severe** Acute health risk, e.g. asphyxiation or risk from explosion	**Likely** The anticipated presence of Made Ground onsite and associated processes of historical demolition and construction enhance the possibility of adverse conditions to a yet unknown depth. No specific, significant sources of ground gas are noted off site. With reference to BS8576 (2013) *Guidance on investigations for ground gas – Permanent gases and Volatile Organic Compounds*, these sources are considered to have a Very Low to Low gassing potential.	**High**	**Generic Quantitative Risk Assessment** Recommended as part of the ground investigation.
Unexploded Ordnance During WWII, the site was located in an area of moderate bombing density, as confirmed by official statistics and mapping	**Direct Contact through all groundwork activities**	**End user of site and Construction Workers** Residents, general public, construction works, site visitors	**Severe** Acute health risk, e.g. risk from explosion	**Low Likelihood** Bombing records for Manchester do not record any bombs within the site boundary. Additionally, the existing building was in place prior to WWII, and occupied during the war increasing the recording of potential UXO on site.	**Moderate**	**Detailed UXO Report** Recommended to be obtained prior to any intrusive works

4.0 Conclusion and Recommendations

The qualitative risk assessment (QRA) determined a varied level of level of risk associated with the proposed development (Low to High).

The QRA concluded by recommending that generic quantitative risk assessments (GQRA) were conducted in order to confirm the assessment of risk ascribed to each of the respective potential pollutant linkages (PPLs). It is recommended that the GQRA is conducted as part of a ground investigation in support of the engineering design of the proposed development an outline scope for which is detailed in the section hereafter.

In summary, the following recommendations are made:

- Undertake an intrusive ground investigation.
- Undertake a GQRA as part of the ground investigation.
- Obtain a Detailed UXO report prior to intrusive works.

It is further recommended that this work is completed in advance of any development works taking place.

5.1 Outline Scope of Works for Ground Investigation

Considering the historic uses of the site and the nature of these sources, potential contamination is expected to be generally dispersed, with localised contamination possibly related to the fire station and associated works located in the southwest area of the site.

On this basis, a non-targeted sampling strategy for the majority of the site is recommended in order to obtain sufficient coverage of the site with reference to the contaminants of concern detailed in the following section.

Reference should also be made to the geotechnical considerations relating to the site as detailed in Section 4.0.

It is envisaged that the ground investigation will comprise the following actions, all undertaken under the supervision of a suitably qualified engineer in line with current guidance and best practice:

- Machine excavated trial pits:
  - To enable logging of the shallow site soils and develop a working ground model.
  - To confirm exaction conditions.
  - To facilitate the retrieval of geotechnical and environmental samples.
  - To enable detailed logging of the site soils to inform the gassing potential of any Made Ground and superficial soils.
  - To facilitate equivalent CBR values to be derived for pavement design.

- Boreholes:
  - To develop a working ground model for the shallow and deeper soils/bedrock.
  - To facilitate the retrieval of geotechnical and environmental samples.
  - To facilitate in-situ geotechnical testing.
  - To enable standpipes to be installed for ground gas and groundwater monitoring.
- Soakaway tests:
  - To confirm the infiltration capacity of the natural deposits in support of the drainage design.
- Associated geotechnical and environmental laboratory testing:
  - To assess the potential risk to end users of the site and other sensitive receptors with reference to the contaminants of concern detailed in Section 6.2 hereafter.
  - To further develop a working ground model for the site.
  - To offer a preliminary assessment of the suitably of available excavated materials for re-use on site and disposal off-site.

At this stage, gas monitoring is recommended in order to confirm the preliminary assessment with due consideration given to the conservativism inherent in monitoring from standpipes. It is recommended that reference is made to Annex E of BS8485:2015 with respect to the assessment of ground gas risk on low to moderate risk sites.

5.2 Contaminants of Concern

Potential contaminants of concern associated with the sources identified within the Conceptual Site Model in Section 3.0 of this reporting include, but are not limited to: broad range aliphatic and aromatic hydrocarbons present within any fuel oils; polycyclic aromatic hydrocarbons (PAHs); inorganic compounds including toxic metals present in ash deposits; and asbestos present in discarded building materials.

Potential contaminants associated with the air-born dust/particulates include, but are not limited to: asbestos, polycyclic aromatic hydrocarbons and inorganic compounds including toxic metals that are also accounted for by potential on-site contaminants of concern.

5.3 Other Considerations

The requirement for additional surveys, e.g. arboricultural and ecological surveys, should be confirmed through advice from a suitably qualified and experienced professional.

Introduction

The Environment Act 1995 has made site sensitivity a key issue, as the legislation pays as much attention to the pathways by which contamination could spread, and to the vulnerable targets of contamination, as it does the potential sources of contamination.
For this reason, Landmark's Site Sensitivity maps and Datasheet(s) place great emphasis on statutory data provided by the Environment Agency/Natural Resources Wales and the Scottish Environment Protection Agency; it also incorporates data from Natural England (and the Scottish and Welsh equivalents) and Local Authorities; and highlights hydrogeological features required by environmental and geotechnical consultants. It does not include any information concerning past uses of land. The datasheet is produced by querying the Landmark database to a distance defined by the client from a site boundary provided by the client.

In the attached datasheet the National Grid References (NGRs) are rounded to the nearest 10m in accordance with Landmark's agreements with a number of Data Suppliers.

Geology 1:50,000 Maps

This report contains geological map extracts taken from the BGS Digital Geological map of Great Britain at 1:50,000 scale and is designed for users carrying out preliminary site assessments who require geological maps for the area around the site. This mapping may be more up to date than previously published paper maps.
The various geological layers - artificial and landslip deposits, superficial geology and solid (bedrock) geology are displayed in separate maps, but superimposed on the final 'Combined Surface Geology' map. All map legends feature on this page. Not all layers have complete nationwide coverage, so availability of data for relevant map sheets is indicated below.

Artificial Ground and Landslip

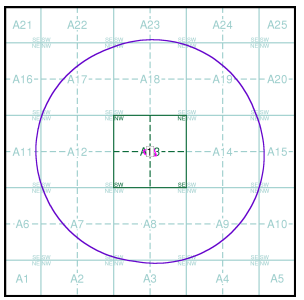

Artificial ground is a term used by BGS for those areas where the ground surface has been significantly modified by human activity. Information about previously developed ground is especially important, as it is often associated with potentially contaminated material, unpredictable engineering conditions and unstable ground.

Artificial ground includes:

- Made ground - man-made deposits such as embankments and spoil heaps on the natural ground surface.
- Worked ground - areas where the ground has been cut away such as quarries and road cuttings.
- Infilled ground - areas where the ground has been cut away then wholly or partially backfilled.
- Landscaped ground - areas where the surface has been reshaped.
- Disturbed ground - areas of ill-defined shallow or near surface mineral workings where it is impracticable to map made and worked ground separately.

Mass movement (landslip) deposits on BGS geological maps are primarily superficial deposits that have moved down slope under gravity to form landslips. These affect bedrock, other superficial deposits and artificial ground. The dataset also includes foundered strata, where the ground has collapsed due to subsidence.

curtins

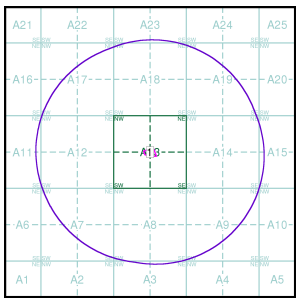

Superficial Geology

Superficial Deposits are the youngest geological deposits formed during the most recent period of geological time, the Quaternary, which extends back about 1.8 million years from the present.

They rest on older deposits or rocks referred to as Bedrock. This dataset contains Superficial deposits that are of natural origin and 'in place'. Other superficial strata may be held in the Mass Movement dataset where they have been moved, or in the Artificial Ground dataset where they are of man-made origin.

Most of these Superficial deposits are unconsolidated sediments such as gravel, sand, silt and clay, and onshore they form relatively thin, often discontinuous patches or larger spreads.

Bedrock and Faults

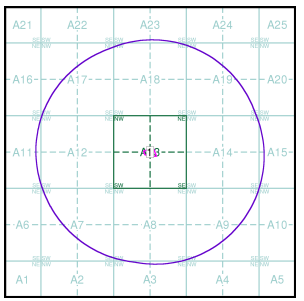

Bedrock geology is a term used for the main mass of rocks forming the Earth and are present everywhere, whether exposed at the surface in outcrops or concealed beneath superficial deposits or water.

The bedrock has formed over vast lengths of geological time ranging from ancient and highly altered rocks of the Proterozoic, some 2500 million years ago, or older, up to the relatively young Pliocene, 1.8 million years ago.

The bedrock geology includes many lithologies, often classified into three types based on origin: igneous, metamorphic and sedimentary.

The BGS Faults and Rock Segments dataset includes geological faults (e.g. normal, thrust), and thin beds mapped as lines (e.g. coal seam, gypsum bed). Some of these are linked to other particular 1:50,000 Geology datasets, for example, coal seams are part of the bedrock sequence, most faults and mineral veins primarily affect the bedrock but cut across the strata and post date its deposition.

Combined Surface Geology

The Combined Surface Geology map combines all the previous maps into one combined geological overview of your site.

Please consult the legends to the previous maps to interpret the Combined "Surface Geology" map.

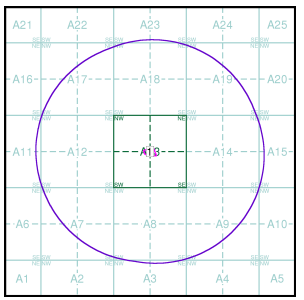

Additional Information

More information on 1:50,000 Geological mapping and explanations of rock classifications can be found on the BGS website. Using the LEX Codes in this report, further descriptions of rock types can be obtained by interrogating the 'BGS Lexicon of Named Rock Units'. This database can be accessed by following the 'Information and Data' link on the BGS website.

Lancashire And Furness

Published 1848

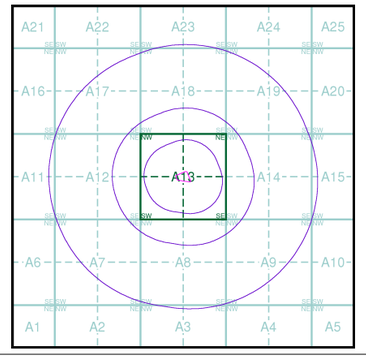

Source map scale - 1:10,560

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840`s. In 1854 the 1:2,500 scale was adopted for mapping urban areas; these maps were used to update the 1:10,560 maps. The published date given therefore is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas. In the late 1940`s, a Provisional Edition was produced, which updated the 1:10,560 mapping from a number of sources. The maps appear unfinished - with all military camps and other strategic sites removed. These maps were initially overprinted with the National Grid. In 1970, the first 1:10,000 maps were produced using the Transverse Mercator Projection. The revision process continued until recently, with new editions appearing every 10 years or so for urban areas.

Manchester

Published 1975

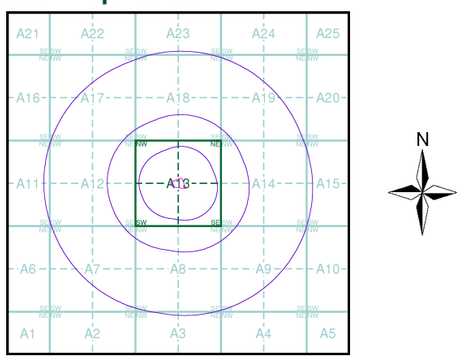

Source map scale - 1:25,000

These maps were produced by the Russian military during the Cold War between 1950 and 1997, and cover 103 towns and cities throughout the U.K. The maps are produced at 1:25,000, 1:10,000 and 1:5,000 scale, and show detailed land use, with colour-coded areas for development, green areas, and non-developed areas. Buildings are coloured black and important building uses (such as hospitals, post offices, factories etc.) are numbered, with a numbered key describing their use.
They were produced by the Russians for the benefit of navigation, as well as strategic military sites and transport hubs, for use if they were to have invaded the U.K. The detailed information provided indicates that the areas were surveyed using land-based personnel, on the ground, in the cities that are mapped.

Ordnance Survey Plan

Published 1980 - 1981

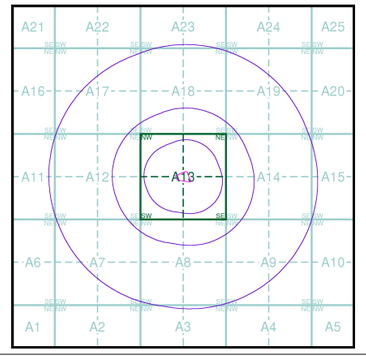

Source map scale - 1:10,000

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840`s. In 1854 the 1:2,500 scale was adopted for mapping urban areas; these maps were used to update the 1:10,560 maps. The published date given therefore is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas. In the late 1940`s, a Provisional Edition was produced, which updated the 1:10,560 mapping from a number of sources. The maps appear unfinished - with all military camps and other strategic sites removed. These maps were initially overprinted with the National Grid. In 1970, the first 1:10,000 maps were produced using the Transverse Mercator Projection. The revision process continued until recently, with new editions appearing every 10 years or so for urban areas.

10k Raster Mapping

Published 1999

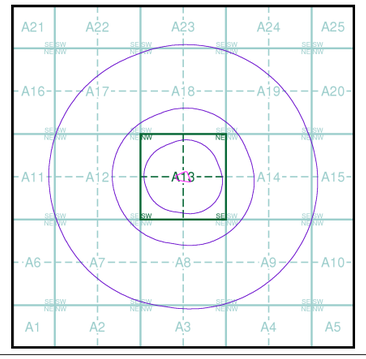

Source map scale - 1:10,000

The historical maps shown were produced from the Ordnance Survey`s 1:10,000 colour raster mapping. These maps are derived from Landplan which replaced the old 1:10,000 maps originally published in 1970. The data is highly detailed showing buildings, fences and field boundaries as well as all roads, tracks and paths. Road names are also included together with the relevant road number and classification. Boundary information depiction includes county, unitary authority, district, civil parish and constituency.

Ordnance Survey Plan

Published 1960 - 1981

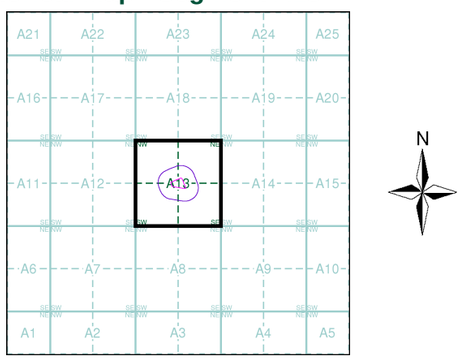

Source map scale - 1:1,250

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840`s. In 1854 the 1:2,500 scale was adopted for mapping urban areas and by 1896 it covered the whole of what were considered to be the cultivated parts of Great Britain. The published date given below is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas.

Supply of Unpublished Survey Information

Published 1974 - 1976

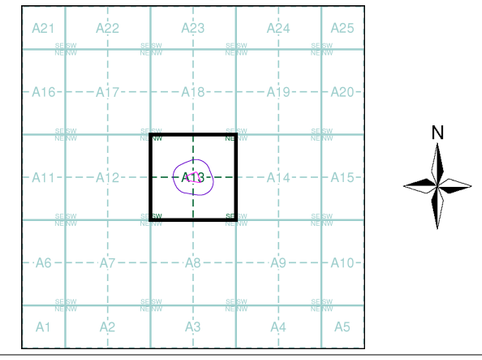

Source map scale - 1:1,250

SUSI maps (Supply of Unpublished Survey Information) were produced between 1972 and 1977, mainly for internal use at Ordnance Survey. These were more of a `work-in-progress' plan as they showed updates of individual areas on a map. These maps were unpublished, and they do not represent a single moment in time. They were produced at both 1:2,500 and 1:1,250 scales.

Large-Scale National Grid Data

Published 1996

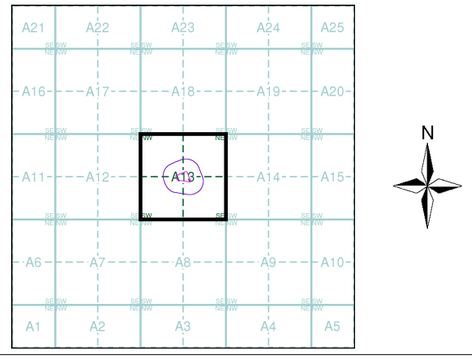

Source map scale - 1:1,250

'Large Scale National Grid Data' superseded SIM cards (Ordnance Survey's 'Survey of Information on Microfilm') in 1992, and continued to be produced until 1999. These maps were the fore-runners of digital mapping and so provide detailed information on houses and roads, but tend to show less topographic features such as vegetation. These maps were produced at both 1:2,500 and 1:1,250 scales.

Lancashire And Furness

Published 1851

Source map scale - 1:1,056

The 1:1056 scale of Ordnance Survey mapping was adopted from Ireland in 1848 and was used to survey towns with a population of over 4000, plus county towns of lesser population, in those counties mapped at the six-inch scale in 1841-55. The scale was the largest scale at which London was mapped by the Ordnance Survey and a 'skeleton' survey of the capital, showing little more than streets, street names, frontages and altitudes, was undertaken between 1848 and 1850. The majority of the 1:1056 surveys were later replaced by 1:500 surveys; although almost all the remainder were revised at this scale, sometimes more than once before 1895. The type of detail shown on the 1:1056 scale is broadly similar to that on 1:500; the apparent omission of minor details such as sewer access points and street lights may be as much a reflection of the generally earlier date of these plans, as of the specification of the map.

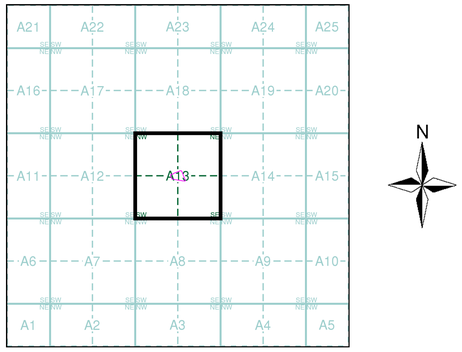

Please note: Due to the partial coverage of Historical Town Plans, it is possible that not all segments within an order will contain mapping. Only the segments that have Town Plan coverage will be generated.

Appendix A4 – Qualitative Risk Assessment Rationale

The aim of the qualitative risk assessment (QRA) is to establish connecting links between a hazardous source to a potential receptor via an exposure pathway.

The QRA corresponds with the total site area.

Risk assessment is the process of collating known information on a hazard or set of hazards in order to estimate actual or potential risk to receptors. The receptor may be humans, a water resource, a sensitive local ecosystem or future construction materials. Receptors can be connected to the hazardous source by one or several exposure pathways such as direct contact for example. Risks are generally managed by isolating the receptor or intercepting the exposure pathway or by isolating or removing the hazard.

Without the three essential components of a source, pathway and receptor there can be no risk. Therefore the presence of hazard on a site does not necessarily mean there is a risk.

By considering where a viable pathway exists which connects a source with a receptor the risk assessment identifies where potential pollutant linkage (PPL) exists. If there is no pollutant linkage there is no risk and only where a pollutant linkage is established does the risk assessment consider the level of risk.

The risk assessment considers the likelihood of a particular event taking place (accounting for the presence of the hazard and receptor and the integrity of the exposure pathway) in conjunction with the severity of the potential consequence (accounting for the potential severity of the hazard and the sensitivity of the receptor).

In the risk assessment the consequence of the hazard has been classified as severe or medium or mild or minor and the probability (likelihood) of the circumstances actually occurring classified as high likelihood or likely or low likelihood or unlikely.

The consequences and probabilities are subsequently cross-correlated to give a qualitative estimation of the risk using Department of the Environment risk classifications as detailed in the table below and as referenced in CIRIA C552.

		Consequence			
		Severe	**Medium**	**Mild**	**Minor**
Probability (Likelihood)	**High Likelihood**	Very High Risk	High Risk	Moderate Risk	Negligible Risk
	Likely	High Risk	Moderate Risk	Moderate/Low Risk	Negligible Risk
	Low Likelihood	Moderate Risk	Moderate/Low Risk	Low Risk	Negligible Risk
	Unlikely	Moderate/Low Risk	Low Risk	Negligible Risk	Negligible Risk

In accordance with DoE guidance, the following categorisation of **consequence** has been developed.

Classification	Definition	Examples
Severe	Short-term (acute) risk to human health likely to result in "significant harm" as defined by the Environment Protection Act 1990, Part IIA. Short-term risk of pollution of sensitive water resource. Catastrophic damage to buildings/property. A short-term risk to a particular ecosystem or organisation forming part of such ecosystem.	High concentrations of cyanide on the surface of an informal recreation area. Major spillage of contaminants from site into controlled water. Explosion, causing building collapse (can also equate to a short-term human health risk if buildings are occupied).
Medium	Chronic damage to Human Health. Pollution of sensitive water resources. A significant change in a particular ecosystem or organism forming part of such ecosystem.	Concentration of a contaminant from site exceeds the generic or site-specific assessment criteria. Leaching of contaminants from a site to a Principal or Secondary A aquifer. Death of a species within a designated nature reserve. Lesser toxic and asphyxiate effects
Mild	Pollution of non-sensitive water resources. Significant damage to crops, buildings, structures and services. Damage to sensitive buildings/structures/services or the environment.	Pollution of non-classified groundwater (inc. Secondary B aquifers). Damage to building rendering it unsafe to occupy (e.g. foundation damage resulting in instability).
Minor	Harm, although not necessarily significant harm, which may result in a financial loss or expenditure to resolve. Non-permanent health effects to human health (easily prevented by means such as personal protective clothing, etc). Easily repairable effects of damage to buildings, structures and services.	The presence of contaminants at such concentrations that protective equipment is required during site works. The loss of plants in a landscaping scheme. Discoloration of concrete.

In accordance with DoE guidance, the following categorisation of **probability** has been developed.

Classification	Definition
High Likelihood	There is a pollution linkage and an event that either appears very likely in the short term and almost inevitable over the long term or there is evidence at the receptor of harm or pollution.
Likely	There is a pollution linkage and all the elements are present and in the right place, which means that it is probable that an event will occur. Circumstances are such that an event is not inevitable, but possible in the short term and likely over the long term.
Low Likelihood	There is a pollution linkage and circumstances are possible under which an event could occur. However, it is by no means certain that even over a longer period such event would take place, and is less likely in the shorter term.
Unlikely	There is a pollution linkage but circumstances are such that it is improbable that an event would occur even in the very long term.

In accordance with DoE guidance, the following categorisation of **risk** has been developed.

Classification	Definition
Very High Risk	There is a *high probability* that *severe harm* could arise to a designated receptor from an identified hazard at the site without appropriate further action.
High Risk	*Harm* is *likely to arise* to a designated receptor from an identified hazard at the site without appropriate further action.
Moderate Risk	*It is possible* that without appropriate further action *harm could arise* to a designated receptor. It is relatively *unlikely* that any such harm would be *severe,* and if any harm were to occur it is *more likely* that such harm would be *relatively mild.*
Low Risk	*It is possible* that *harm could arise* to a designated receptor from an identified hazard. It is *likely* that, at worst, if any harm was realised any effects would be *mild.*
Negligible Risk	The presence of an identified hazard does not give rise to the potential to cause harm to a designated receptor.

The term 'risk' in this instance refers to the risk that the source, pathway, receptor linkage for a given source of contamination is complete. It does not refer to immediate risk to individuals or features present on the site from potential contaminants and is intended to be used as a tool to assess the necessity of further investigation.
