Executive Summary

Appointment	In September 2018, Curtins were instructed by Morgan Sindall to undertake a Phase 1 Preliminary Risk Assessment of the Gorton Community Hub site off Garratt Way, Gorton, Manchester. The site is centred on NGR 388510, 396220, and covers an area of approximately 1.16 Ha. It is understood that development proposals comprise the demolition of the existing buildings and the construction of a 3 - 4 storey Community Hub building on the Eastlands Homes site, with the disused pub to be used as surface car parking.
Current Site Status	The site is currently occupied by a disused pub, Eastland's Home building and associated carparking area with areas of soft landscaping.
Site History	From the mid-19th Century to the late 19th Century, the site was an undeveloped agricultural field. In 1893 the site consisted of terraced houses and a hotel. In the early 20th Century terraced housing was built in all areas of the site and surrounding area. Ponds which were located within 250m of the site were infilled when the houses were built. The houses in the north of the site were demolished by 1978 and all were demolished by 1983. In the same year, the site comprised of a community centre with associated car park and a hotel.
Geology	Some Made Ground is anticipated to be present considering the site's history of redevelopment. Superficial deposits are recorded as Glacial Till (sandy, silt, gravelly Clay) underlain by bedrock noted as the Chester Formation (gravelly, pebbly Sandstone and Mudstone). A BGS recorded borehole 43m to the west indicates Made Ground to depths of 1.40m bgl, underlain by clay in excess of 5m bgl.
Hydrogeology	The site is underlain by a Principal Aquifer associated with the bedrock formation, a Secondary Undifferentiated Aquifer associated with superficial deposits and is not located within a Source Protection Zone. There is one groundwater abstraction located within 500m of the site, this is located 444m west of the site, used for dust suppression.
Hydrology	The nearest surface water feature is the Gore Brook located 269m west of the sites, flowing southwest to northeast direction, river quality is not available. There are no recorded surface water abstraction points recorded within 1km and no pollution incidents have been recorded within 250m of the site within the last 10 years.
Unexploded Ordnance Risk	The site is situated in Gorton east of Manchester City Centre. A review of available Manchester Bomb Damage mapping and the historical mapping indicates that there are no bombing ruins, damaged buildings, or fire bombs onsite or in the local area. The risk from UXO to construction workers is therefore considered to be **Low**.
Initial Ground Contamination Assessment	The risk, from Made Ground, posed to site end-users is considered to be **Moderate/Low** due to the site's limited historical and lack of industrial use; and the risk posed to groundwater and surface water is **Moderate/Low** and **Very Low** respectively. The risk posed to end-users from ground generating gases is considered to be **Moderate/Low**.
Other Considerations	There may be subsurface obstructions, voids and relic foundations associated with the current building onsite.
Recommendations	The following recommendations are made with regards to further works at the site: 1. Undertake an intrusive ground investigation; 2. Undertake a GQRA as part of the ground investigation; and 3. Undertake Ground Gas Monitoring. It is further recommended that this work is completed in advance of any development works taking place.

1.0 Introduction

1.1 Project Background

In September 2018 Curtins were instructed by Morgan Sindall to undertake a Phase 1 Preliminary Risk Assessment of the Gorton Community Hub site off Garratt Way, Gorton, Manchester, M18 8LD.

The location of the site is shown in *Figure 2.1* and is represented by Section 1. The site is currently occupied by a disused pub, Eastland's Home building and associated carparking area with areas of soft landscaping.

Section 2 as shown in *Figure 2.1* is occupied by Gorton Library and associated carparking and soft landscaping, and is outside the scope of this report.

1.2 Scope of Services

The Phase 1 is intended to provide an overview of the geo-environmental and geotechnical setting of the site, prior to the proposed development which comprises of the demolition of the existing buildings and the construction of a 3 to 4 storey Community Hub building on the Eastlands Homes site, with the disused pub to be surface car parking.

Proposed development drawings for the Community Hub building are included in *Appendix A*.

Through this overview, the Phase 1 aims to develop both a working conceptual and ground model for the site, as well as present an initial assessment of any risks that could be presented to the development including its intended end users and the wider environment.

Specifically, the Phase 1 provides an initial assessment of the site regarding:

a) Potential contamination of the site strata by historical and or current use;
b) The potential impact on the wider environment by historical and or current use of the site of interest;
c) The potential impact from surrounding land uses and other environmental factors;
d) Potential problems associated with geological features such as faulting, mineral extraction, mining and land instability;
e) The location of apparent sub-surface structures that may affect the proposed redevelopment; and
f) The location of above-surface features that may affect the proposed redevelopment.

Consideration of detailed flood risk, ecology and archaeological issues are outside of the scope of this report.

2.0 Current Site and Surrounding Area Details

2.1 Site Location and Current Details

Site use, location and description are shown below in *Table 2.1* and *Figure 2.1* on the following page. A site walkover was undertaken by Curtins on 18th November 2018 and photographs are included in *Appendix B.*

Table 2.1 – *Site Details*

Site Address	Gorton Community Hub, Garratt Way, Manchester, M18 8HE
NGR	388510, 396220
Area of Site	Approximately 1.16 Ha
Current Site Use and Description	A site walkover recorded the following pertinent details: • The site is generally topographically level. • There are sections of the site along the north and south boundary which are grassland with the rest of the site hardstanding for use as roads and carparks. • A disused pub is located on the eastern side of the site. • The Eastland's Homes building is located in the central west of the site. • There are manhole covers located in the road which runs through the centre of the site and in the Eastland's Home carpark. • There is an old footpath in the grassland area in the southwest of the site behind the Eastland's Home building.

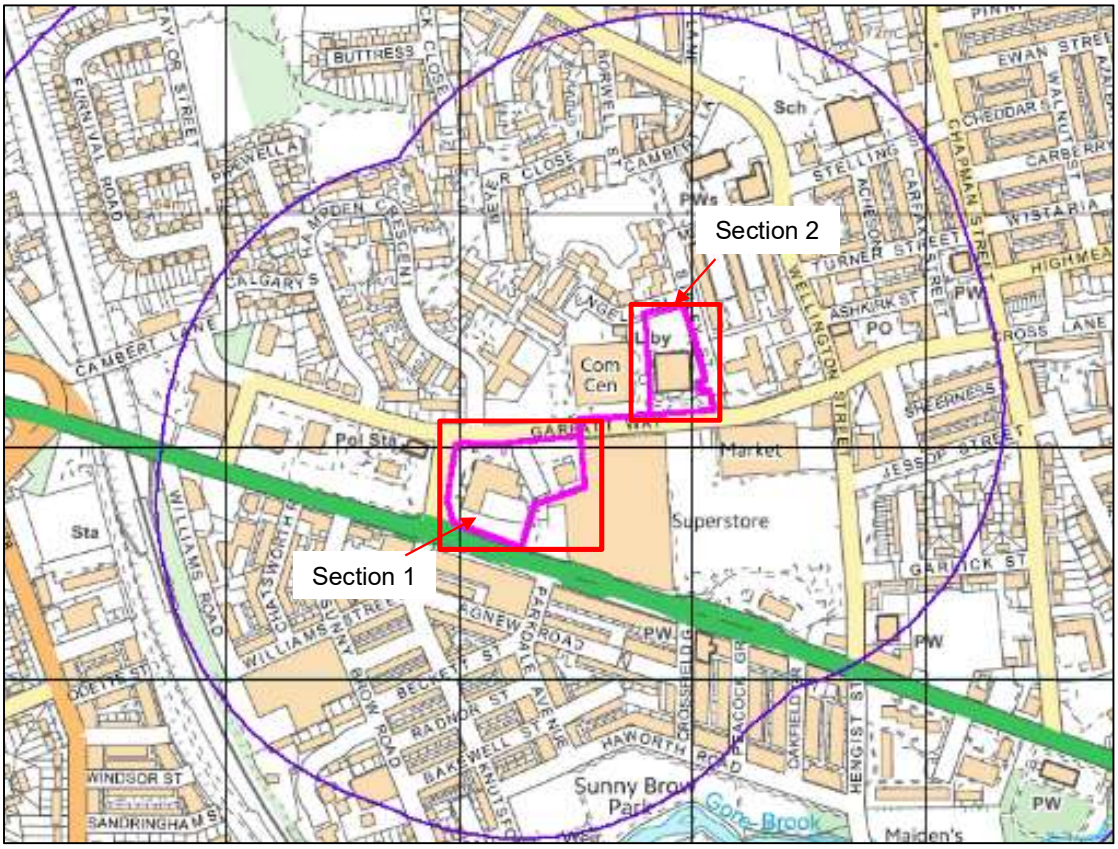

Figure 2.1 – Site Location Plan (site boundary shown in pink and 250m buffer in purple).
Crown Copyright. License Number 100022432.

2.2 Surrounding Area Details

The following information was also established during the site visit and through undertaking an environmental database search (Envirocheck report (Ref.1) included in *Appendix C*).

Table 2.2 – *Surrounding Land Uses*

Surrounding Area	**N**	Public open space with residential dwellings beyond.
	E	Tesco extra.
	W	Gorton Police Station and KFC.
	S	Commercial buildings.

3.0 Site History

A review of the available historical mapping and other information for the site, as presented within the Envirocheck report (Ref.1), has been undertaken and is presented in *Table 3.0* below.

Table 3.0 – *Previous Site and Surrounding Area Uses and Potential Sources of Contamination*

Date	Description	Potential Sources of Contamination
1848-1893	Mapping dated 1848 shows the site and surrounding site is an undeveloped agricultural field. By 1893, the site has three sets of terraced houses and a hotel named Suburban Hotel in the northeast corner of the site and terraced houses in the southeast and southwest of the site. The surrounding area consist of a tramway line 10m south of the site. There are three ponds within 250m radius from the site located 46m and 72m northeast, and 110m south. There are terraced houses located adjacent to the southeast and north of the site	• Uncontrolled deposition of Made Ground from construction of buildings onsite and the surrounding area.
1908-1973	Mapping dated 1908 shows terraced houses have been across the site and the surrounding area. All ponds are no longer mapped and have been potentially infilled and the football ground has been replaced by houses.	• Uncontrolled deposition of Made Ground from construction of buildings onsite and the surrounding area. • Potential infilled ponds surrounding the site.
1978-1992	In 1978, houses in the north of the site have been demolished. In 1983 all houses across the site have been demolished and replaced by a community centre with associated car park in the central west of the site and the Suburban Hotel in the east of the site.	• Uncontrolled deposition of Made Ground from demolition/ construction of buildings onsite.
2018	Little change on or immediately surrounding the site.	• Limited potential for additional onsite contamination.

There are no BGS recorded landfills or active Licensed Waste Management Facilities within 500m of the site.

There are 2 historic landfills within 500m of the site, one located 434m southwest and waste recorded as household waste (ref EAHLD16605). The second landfill is located 496m northeast and waste recorded as inert waste and liquid sludge (ref. EAHLD16523.

Potential sources of onsite contamination are further discussed in *Section 6.0*.

Copyright ©2019 Curtins Consulting Ltd

4.0 Geology, Hydrogeology and Hydrology

4.1 Geology and Hydrogeology

A study of the Envirocheck records, British Geological Survey (BGS) 1:50,000 mapping records (Bedrock and Superficial Editions) for Manchester (Sheet 85) (Ref.2) indicates the following geological and hydrogeological succession underlying the site:

Table 4.1 – *Geological/Hydrogeological Succession*

Geology	Associated Hydrogeological Classification
Made Ground deposits are not indicated to be present, however some are expected due to historical development onsite.	N/A
Glacial Till[1]	Secondary Undifferentiated Aquifer[3]
Chester Formation[2]	Principal Aquifer[4]

Notes:
1. *These comprise a group of sediments laid down by the direct action of glacial ice, usually sandy, silty clay with pebbles, but can contain gravel-rich, or laminated sand layers; varied in colour and consistency.*
2. *These rocks comprise of conglomerates which are reddish brown, cross-bedded, pebbly sandstones with subordinate beds of red-brown mudstone. The conglomerates have a reddish brown sandy matrix and consist mainly of pebbles of brown or purple quartzite, with quartz conglomerate and vein quartz.*
3. *This is assigned in cases where it has not been possible to attribute either category A or B to a rock type. In most cases, this means that the layer in question has previously been designated as both minor and non-aquifer in different locations due to the variable characteristics of the rock type.*
4. *These are layers of rock or drift deposits that have high intergranular and/or fracture permeability – meaning they usually provide a high level of water storage. They may support water supply and/or river base flow on a strategic scale.*

There are no BGS recorded faults onsite. The closest fault is located 950m west of the site.

There are two BGS recorded available boreholes (Ref.3) located within 100m of the site, details of which are presented within *Table 4.2* below:

Table 4.2 – *BGS Borehole Records*

Record Reference	Location (NGR)	Details (thickness of strata/details/bottom of strata)	
SJ89NE1182	43m west (388350, 396170)	1.40m bgl 0.60m bgl 5.00m bgl *7.00m bgl*	Brick fill (1.40m) Firm grey/brown silty CLAY with occasional pebbles (2.00m) Stiff brown silty CLAY with occasional pebbles and sand inclusions (7.00m) *borehole termination*

Record Reference	Location (NGR)	Details (thickness of strata/details/bottom of strata)	
SJ89NE1181	63m southeast (388550, 396120)	1.20m bgl 5.80m bgl *7.00m bgl*	Brick fill (1.20m) Firm to stiff brown silty CLAY with occasional pebbles (7.00m) *borehole termination*

The site is located within a zone of high leaching potential but not within a nitrate vulnerable zone. The site is not situated within a Source Protection Zone (SPZ). There is one groundwater abstraction located within 500m of the site, located 444m west of the site and operated by GRA Ltd. It is used for sports grounds/facilities as dust suppression, licence number 2569006043.

4.1.1 Mining

The site is within a coal mining reporting area. However, a review of the Coal Authority interactive mapping (Ref. 4) for the area indicates that the site is 1km southeast of the nearest mine entries, coal outcrops, areas of development high risk and probably shallow coal mining areas.

Therefore, the risk to the development from coal mine workings is Low and has not been considered further.

There are no recorded mineral sites within 750m of the site.

4.1.2 Other Ground Stability Issues

The Envirocheck Report confirms that there is a no hazard to very low risk from the following ground stability hazards on and around the site; collapsible ground, compressible ground, ground dissolution, landslide ground, running sands and shrinking or swelling clay.

4.1.3 Ground Gas

The BGS Radon Mapping (Ref.5) confirms the site is situated in a lower probability radon area where <1% of homes are at or above the radon action level. On this basis, radon protection measures are not considered necessary in the construction of new dwellings or extensions.

If the new development incorporates a basement, the advice of a specialist Radon assessor must be obtained.

4.2 Hydrology

The nearest surface water feature is the Gore Brook 269m south, flowing in a southwest to northeast direction, river quality is not available.

No pollution incidents have been recorded within 250m of the site within the last 10 years. There are no surface water abstractions recorded within 1km of the site. There are no discharge consents within 250m of the site.

Copyright ©2019 Curtins Consulting Ltd

5.0 Unexploded Ordnance Risk Assessment

Military activities including those conducted as part of both the First and Second World Wars have resulted in a legacy of unexploded ordnance (UXO) being present within the shallow soils of the UK.

UXO result from various sources including both allied (military training) and German (bombing raids) with a guide figure of approximately 10% of all munitions failing to function as designed.

The likelihood of UXO being encountered on a development site is influenced by several factors including; the proximity to strategic targets, the nature of the development works being undertaken and evidence of local damage in the post-war periods amongst others. To determine the likelihood of UXO being present on a site, a step-wise risk assessment process is followed. This process is outlined within CIRIA C681 Unexploded Ordnance: A Guide for the Construction Industry (Ref.6) with the following commentary considered to represent a Preliminary Risk Assessment intended to guide if and where there is a requirement for a Detailed Risk Assessment.

5.1 Preliminary UXO Assessment

Risk mapping (Ref.7) for UXO's has placed the site in a moderate risk area. Moderate risk areas are those that show a density of bombing hits of 11-50 bombs per 1000 acres and may contain potential WWII targets. Manchester generally escaped the worst of Britain's WWII bombing, particularly when compared with other major UK cities, such as Liverpool or London. Furthermore, the peripheries of Manchester were only bombed sporadically, with the major targets in the city consisting of the port, city centre and industry in Stretford.

A review of the available historic mapping shows no ruins on or within 250m of the site. No buildings or areas of development suddenly disappear in post-war mapping.

Analysis of online bomb damage maps for Manchester (Ref.8) shows that there was no fire bomb strikes, demolished/damaged buildings or ruins onsite or surrounding the site, as shown in *Figure 5.1* on the following page.

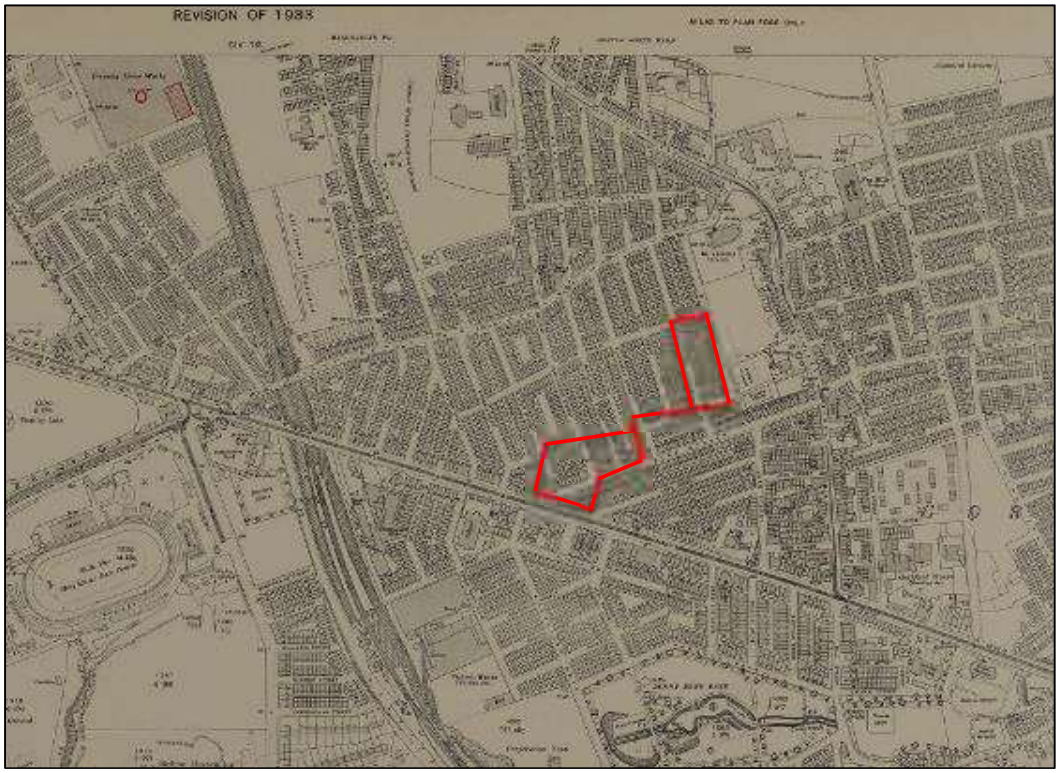

Figure 5.1 – Map of bomb damage in Manchester from WWII (red line shows site boundary, red circles show locations of fire bombs, red shading shows locations of demolished buildings).
Copyright 2016 The University of Manchester.

Based on the forgoing commentary, the likelihood of encountering UXO on site as part of the ground investigation or development works is **Low**, and on this basis no further action is considered to be required.

If unexploded ordnance is discovered, stop immediately, prevent access to the area, and inform the police. If the site boundary or location changes then the UXO risk should be reassessed.

6.0 Conceptual Site Model & Qualitative Risk Assessment

The conceptual site model (CSM) and Qualitative Risk Assessment (QRA) are presented in the table within this section. A diagrammatic CSM is contained within *Appendix A*.

The CSM details the source-pathway-receptor linkages or potential pollutant linkages (PPL) that have been identified for the site. The QRA details the associated level of risk relating to these potential pollutant linkages.

The CSM and QRA concern risk to human health and water environment with additional, more specific risk assessment protocols contained within the main body of this reporting, as detailed in *Section 6.1* below.

The QRA follows the framework outlined within CIRIA C552 (Ref.9) which is summarised within *Appendix D.*

The 'risk rating' within the QRA refers to the risk that the source, pathway, receptor linkage or PPL is complete. Unless specifically stated it does not necessarily refer to an immediate risk and is intended to be used as a tool to assess the necessity for further assessment/investigation.

6.1 Additional Risk Assessments

The following risk assessments, listed below, are not included within the main CSM and QRA but nonetheless can be of critical importance to the onward development of the site:

- The risk presented by Mining is discussed and assessed in *Section 4.1.1*.
- The risk presented by Radon is discussed and assessed in *Section 4.1.3*.
- The risk presented by Unexploded Ordnance is discussed and assessed in *Section 5.0*.

Under current health and safety legislation, employers are required to carry out their own appropriate risk assessments and mitigation to protect themselves and their employees, other human receptors and the environment from potential contamination. Such risks must be adequately mitigated by law, specifically the Construction Design Management (CDM) Regulations, 2015 (Ref.10) which require that potential risks to human health and the environment from construction activities are appropriately identified and all necessary steps taken to eliminate / manage that risk. It has been assumed that any future construction works on site will be undertaken in compliance with these requirements and therefore construction workers involved in the building works at the site have been discounted as a human receptor in the conceptual site model.

- The table below represents the first stage in the land quality risk assessment process: The Qualitative Risk Assessment.
- For a development site to be deemed 'suitable for use', the level of risk needs to be brought down to acceptable levels, i.e. low to very low risk. The purpose of each stage of risk assessment is ultimately to establish, if there is a requirement for additional levels of assessment to be made to have sufficient confidence to support a risk characterisation or management decision, e.g. remedial action.
- In the absence of specific site data, a Generic Quantitative Risk Assessment is invariably recommended.

Conceptual Site Model			Qualitative Risk Assessment			Recommended Actions
Source	**Pathway(s)**	**Receptor(s)**	**Consequence**	**Likelihood of Occurrence**	**Risk Rating**	
Made Ground of unknown composition from uncontrolled deposition of construction/demolition onsite.	Direct contact, ingestion, inhalation (dust and vapours)	**End-user of site**	**Medium** Chronic health risk	**Low** Considering the sites historical use, it is considered the likelihood of encountering contamination within Made Ground deposits is Low. Notwithstanding, the presence of localised contamination cannot be discounted until further investigation has been undertaken.	**Moderate / Low**	**Generic Quantitative Risk Assessment** Recommended as part of the ground investigation.
	Vertical migration through the superficial deposits (soils) May occur due to existing service corridors and physical processes including; capillary action and downwards into the natural deposits through infiltration.	**Controlled Waters** (groundwater) Principal Aquifer (bedrock) & Secondary Undifferentiated Aquifer (superficial deposits). There is one groundwater abstraction point within 500m but is not for potable use and the site is not within a designated Source Protection Zone.	**Medium** Pollution of sensitive water resources	**Low** Migration could occur into the underlying Principal Aquifer but considered low risk considering the distance to an abstraction point.	**Moderate / Low**	
	Horizontal migration over and through the superficial deposits (soils)	**Controlled Waters** (surface water) Nearest surface water course is Gore Brook 269m south of the site. No surface water abstraction points within 1km.	**Mild** Pollution of low sensitivity water resources	**Unlikely** Considering the distance from the site to the nearest surface water receptor, this pathway is considered unlikely.	**Very Low**	No further action required.
Production of ground generating gases from Made Ground deposits containing organic/ putrescible content. Three potential infilled ponds, two located 46m and 72m northeast and north respectively and another 110m south from site, of unknown infill material.	Vertical and horizontal migration through existing service corridors and the underlying superficial deposits	**End-user of site**	**Medium** Human health risk	**Low** Considering the unlikelihood of extensive organically rich Made Ground deposits at the site, the potential for ground gas generation is considered Low.	**Moderate / Low**	**Generic Quantitative Risk Assessment** Recommended as part of the ground investigation.

7.0 Conclusion and Recommendations

The qualitative risk assessment (QRA) determined a varied level of level of risk associated with the proposed development.

The QRA concluded by recommending that generic quantitative risk assessments (GQRA) were conducted to confirm the assessment of risk ascribed to each of the respective potential pollutant linkages (PPLs). It is recommended that the GQRA is conducted as part of a ground investigation in support of the engineering design of the proposed development.

In summary, the following recommendations are made:

- Undertake an intrusive ground investigation;
- Undertake a GQRA as part of the ground investigation; and
- Undertake ground gas monitoring.

It is further recommended that the site investigation works are completed in advance of any development works taking place.

7.1 Contaminants of Concern

Potential contaminants of concern associated with the sources identified within the Conceptual Site Model in *Section 6.0* of this reporting include but are not limited to: broad range aliphatic and aromatic hydrocarbons present within any fuel oils; polycyclic aromatic hydrocarbons (PAHs); inorganic compounds including heavy metals; and asbestos present in discarded building materials.

Potential contaminants associated with the airborne dust/particulates include but are not limited to: polycyclic aromatic hydrocarbons and inorganic compounds including toxic metals that are also accounted for by potential onsite contaminants of concern.

7.2 Other Considerations

There may be subsurface obstructions, voids and relic foundations associated with the current building onsite.

The requirement for additional surveys, e.g. arboricultural and ecological surveys, should be confirmed through advice from a suitably qualified and experienced professional.

Introduction

The Environment Act 1995 has made site sensitivity a key issue, as the legislation pays as much attention to the pathways by which contamination could spread, and to the vulnerable targets of contamination, as it does the potential sources of contamination.
For this reason, Landmark's Site Sensitivity maps and Datasheet(s) place great emphasis on statutory data provided by the Environment Agency/Natural Resources Wales and the Scottish Environment Protection Agency; it also incorporates data from Natural England (and the Scottish and Welsh equivalents) and Local Authorities; and highlights hydrogeological features required by environmental and geotechnical consultants. It does not include any information concerning past uses of land. The datasheet is produced by querying the Landmark database to a distance defined by the client from a site boundary provided by the client.
In this datasheet the National Grid References (NGRs) are rounded to the nearest 10m in accordance with Landmark's agreements with a number of Data Suppliers.

Geology 1:50,000 Maps

This report contains geological map extracts taken from the BGS Digital Geological map of Great Britain at 1:50,000 scale and is designed for users carrying out preliminary site assessments who require geological maps for the area around the site. This mapping may be more up to date than previously published paper maps.
The various geological layers - artificial and landslip deposits, superficial geology and solid (bedrock) geology are displayed in separate maps, but superimposed on the final 'Combined Surface Geology' map. All map legends feature on this page. Not all layers have complete nationwide coverage, so availability of data for relevant map sheets is indicated below.

Artificial Ground and Landslip

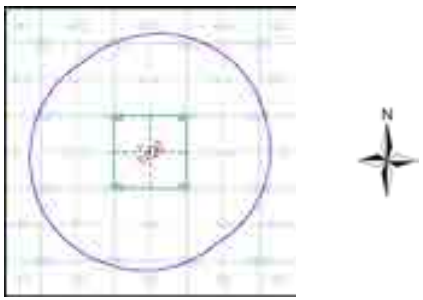

Artificial ground is a term used by BGS for those areas where the ground surface has been significantly modified by human activity. Information about previously developed ground is especially important, as it is often associated with potentially contaminated material, unpredictable engineering conditions and unstable ground.

Artificial ground includes:

- Made ground - man-made deposits such as embankments and spoil heaps on the natural ground surface.
- Worked ground - areas where the ground has been cut away such as quarries and road cuttings.
- Infilled ground - areas where the ground has been cut away then wholly or partially backfilled.
- Landscaped ground - areas where the surface has been reshaped.
- Disturbed ground - areas of ill-defined shallow or near surface mineral workings where it is impracticable to map made and worked ground separately.

Mass movement (landslip) deposits on BGS geological maps are primarily superficial deposits that have moved down slope under gravity to form landslips. These affect bedrock, other superficial deposits and artificial ground. The dataset also includes foundered strata, where the ground has collapsed due to subsidence.

Superficial Geology

Superficial Deposits are the youngest geological deposits formed during the most recent period of geological time, the Quaternary, which extends back about 1.8 million years from the present.

They rest on older deposits or rocks referred to as Bedrock. This dataset contains Superficial deposits that are of natural origin and 'in place'. Other superficial strata may be held in the Mass Movement dataset where they have been moved, or in the Artificial Ground dataset where they are of man-made origin.

Most of these Superficial deposits are unconsolidated sediments such as gravel, sand, silt and clay, and onshore they form relatively thin, often discontinuous patches or larger spreads.

Bedrock and Faults

Bedrock geology is a term used for the main mass of rocks forming the Earth and are present everywhere, whether exposed at the surface in outcrops or concealed beneath superficial deposits or water.

The bedrock has formed over vast lengths of geological time ranging from ancient and highly altered rocks of the Proterozoic, some 2500 million years ago, or older, up to the relatively young Pliocene, 1.8 million years ago.

The bedrock geology includes many lithologies, often classified into three types based on origin: igneous, metamorphic and sedimentary.

The BGS Faults and Rock Segments dataset includes geological faults (e.g. normal, thrust), and thin beds mapped as lines (e.g. coal seam, gypsum bed). Some of these are linked to other particular 1:50,000 Geology datasets, for example, coal seams are part of the bedrock sequence, most faults and mineral veins primarily affect the bedrock but cut across the strata and post date its deposition.

Combined Surface Geology

The Combined Surface Geology map combines all the previous maps into one combined geological overview of your site.

Please consult the legends to the previous maps to interpret the Combined "Surface Geology" map.

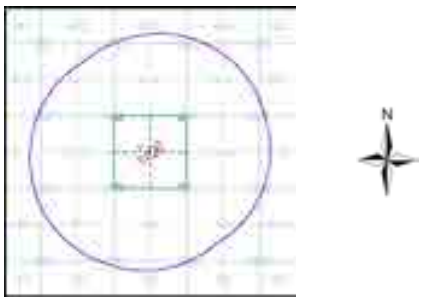

Additional Information

More information on 1:50,000 Geological mapping and explanations of rock classifications can be found on the BGS website. Using the LEX Codes in this report, further descriptions of rock types can be obtained by interrogating the 'BGS Lexicon of Named Rock Units'. This database can be accessed by following the 'Information and Data' link on the BGS website.

Lancashire And Furness

Published 1848

Source map scale - 1:10,560

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840`s. In 1854 the 1:2,500 scale was adopted for mapping urban areas; these maps were used to update the 1:10,560 maps. The published date given therefore is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas. In the late 1940`s, a Provisional Edition was produced, which updated the 1:10,560 mapping from a number of sources. The maps appear unfinished - with all military camps and other strategic sites removed. These maps were initially overprinted with the National Grid. In 1970, the first 1:10,000 maps were produced using the Transverse Mercator Projection. The revision process continued until recently, with new editions appearing every 10 years or so for urban areas.

Source map scale - 1:10,000

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840`s. In 1854 the 1:2,500 scale was adopted for mapping urban areas; these maps were used to update the 1:10,560 maps. The published date given therefore is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas. In the late 1940`s, a Provisional Edition was produced, which updated the 1:10,560 mapping from a number of sources. The maps appear unfinished - with all military camps and other strategic sites removed. These maps were initially overprinted with the National Grid. In 1970, the first 1:10,000 maps were produced using the Transverse Mercator Projection. The revision process continued until recently, with new editions appearing every 10 years or so for urban areas.

10k Raster Mapping

Published 1999

Source map scale - 1:10,000

The historical maps shown were produced from the Ordnance Survey`s 1:10,000 colour raster mapping. These maps are derived from Landplan which replaced the old 1:10,000 maps originally published in 1970. The data is highly detailed showing buildings, fences and field boundaries as well as all roads, tracks and paths. Road names are also included together with the relevant road number and classification. Boundary information depiction includes county, unitary authority, district, civil parish and constituency.

Supply of Unpublished Survey Information

Published 1973

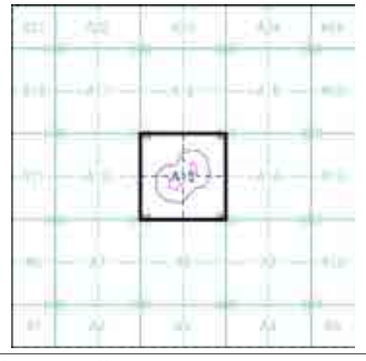

Source map scale - 1:1,250

SUSI maps (Supply of Unpublished Survey Information) were produced between 1972 and 1977, mainly for internal use at Ordnance Survey. These were more of a `work-in-progress' plan as they showed updates of individual areas on a map. These maps were unpublished, and they do not represent a single moment in time. They were produced at both 1:2,500 and 1:1,250 scales.

Additional SIMs

Published 1978 - 1991

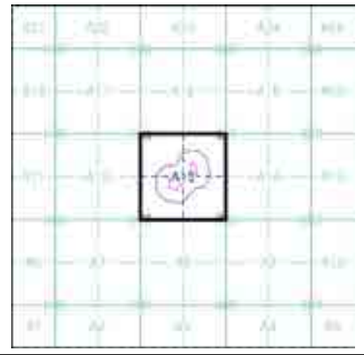

Source map scale - 1:1,250

The SIM cards (Ordnance Survey's `Survey of Information on Microfilm') are further, minor editions of mapping which were produced and published in between the main editions as an area was updated. They date from 1947 to 1994, and contain detailed information on buildings, roads and land-use. These maps were produced at both 1:2,500 and 1:1,250 scales.

Large-Scale National Grid Data

Published 1992

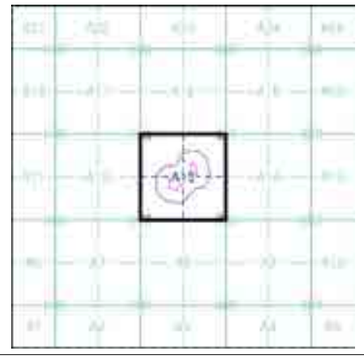

Source map scale - 1:1,250

'Large Scale National Grid Data' superseded SIM cards (Ordnance Survey's 'Survey of Information on Microfilm') in 1992, and continued to be produced until 1999. These maps were the fore-runners of digital mapping and so provide detailed information on houses and roads, but tend to show less topographic features such as vegetation. These maps were produced at both 1:2,500 and 1:1,250 scales.

Large-Scale National Grid Data

Published 1993 - 1995

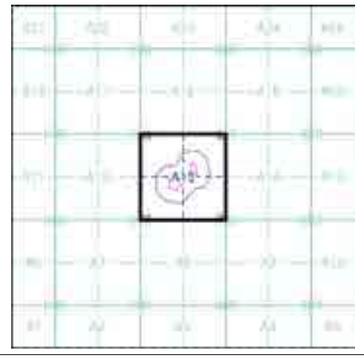

Source map scale - 1:1,250

'Large Scale National Grid Data' superseded SIM cards (Ordnance Survey's 'Survey of Information on Microfilm') in 1992, and continued to be produced until 1999. These maps were the fore-runners of digital mapping and so provide detailed information on houses and roads, but tend to show less topographic features such as vegetation. These maps were produced at both 1:2,500 and 1:1,250 scales.

Appendix D Qualitative Risk Assessment Rationale

The site-specific risk assessment, presented in this report, follows the principle of establishing whether there is a viable linkage between a contaminant source to a potential receptor, via an exposure pathway.

The risk assessment corresponds with the total site area and incorporates both descriptive (qualitative) and, where available, numerical (quantitative) lines of evidence.

Risk assessment is the process of collating known information on a hazard or set of hazards to estimate actual or potential risk to receptors. The receptor may be humans, a water resource, a sensitive local ecosystem or future construction materials. Receptors can be connected to the source by one or several exposure pathways such as direct contact for example. Risks are generally managed by isolating the receptor or intercepting the exposure pathway or by isolating or removing the hazard.

Without the three essential components of a source, pathway and receptor there can be no risk. Therefore, the presence of contaminant source on a site does not necessarily mean there is a risk.

The risk assessment considers the likelihood of an event taking place (accounting for the presence of the source and receptor and the viability of the exposure pathway) in conjunction with the severity of the potential consequence (accounting for the potential severity of the hazard and the sensitivity of the receptor).

In the risk assessment, the consequence of the hazard has been classified as severe or medium or mild or minor and the probability (likelihood) of the circumstances occurring classified as high likelihood or likely or low likelihood or unlikely.

The consequences and probabilities are subsequently cross-correlated to give a qualitative estimation of the risk using Department of the Environment risk classifications as detailed in the table below and as referenced in CIRIA C552.

		Consequence			
		Severe	**Medium**	**Mild**	**Minor**
Probability (Likelihood)	**High Likelihood**	Very High Risk	High Risk	Moderate Risk	Moderate/Low Risk
	Likely	High Risk	Moderate Risk	Moderate/Low Risk	Low Risk
	Low Likelihood	Moderate Risk	Moderate/Low Risk	Low Risk	Very Low Risk
	Unlikely	Moderate/Low Risk	Low Risk	Very Low Risk	Very Low Risk

In accordance with DoE guidance, the following categorisation of **consequence** has been developed.

Classification	Definition	Examples
Severe	Short-term (acute) risk to human health likely to result in "significant harm" as defined by the Environment Protection Act 1990, Part IIA. Short-term risk of pollution of sensitive water resource. Catastrophic damage to buildings/property. A short-term risk to an ecosystem or organisation forming part of such ecosystem.	High concentrations of cyanide on the surface of an informal recreation area. Major spillage of contaminants from site into controlled water. Explosion, causing building collapse (can also equate to a short-term human health risk if buildings are occupied).
Medium	Chronic damage to Human Health. Pollution of sensitive water resources. A significant change in an ecosystem or organism forming part of such ecosystem.	Concentration of a contaminant from site exceeds the generic or site-specific assessment criteria. Leaching of contaminants from a site to a Principal or Secondary A aquifer. Death of a species within a designated nature reserve. Lesser toxic and asphyxiate effects
Mild	Pollution of non-sensitive water resources. Significant damage to crops, buildings, structures and services. Damage to sensitive buildings/structures/services or the environment.	Pollution of non-classified groundwater (inc. Secondary B aquifers). Damage to building rendering it unsafe to occupy (e.g. foundation damage resulting in instability).
Minor	Harm, although not necessarily significant harm, which may result in a financial loss or expenditure to resolve. Non-permanent health effects to human health (easily prevented by means such as personal protective clothing, etc). Easily repairable effects of damage to buildings, structures and services.	The presence of contaminants at such concentrations that protective equipment is required during site works. The loss of plants in a landscaping scheme. Discoloration of concrete.

In accordance with DoE guidance, the following categorisation of **probability** has been developed.

Classification	Definition
High Likelihood	There is a pollution linkage and an event that either appears very likely in the short term and almost inevitable over the long term or there is evidence at the receptor of harm or pollution.
Likely	There is a pollution linkage and all the elements are present and in the right place, which means that it is probable that an event will occur. Circumstances are such that an event is not inevitable, but possible in the short term and likely over the long term.
Low Likelihood	There is a pollution linkage and circumstances are possible under which an event could occur. However, it is by no means certain that even over a longer period such event would take place and is less likely in the shorter term.
Unlikely	There is a pollution linkage, but circumstances are such that it is improbable that an event would occur even in the very long term.

In accordance with DoE guidance, the following categorisation of **risk** has been developed.

Classification	Definition
Very High Risk	There is a *high probability* that *severe harm* could arise to a designated receptor from an identified hazard at the site without appropriate further action.
High Risk	*Harm* is *likely to arise* to a designated receptor from an identified hazard at the site without appropriate further action.
Moderate Risk	*It is possible* that without appropriate further action *harm could arise* to a designated receptor. It is relatively *unlikely* that any such harm would be *severe,* and if any harm were to occur it is *more likely* that such harm would be *relatively mild.*
Low Risk	*It is possible* that *harm could arise* to a designated receptor from an identified hazard. It is *likely* that, at worst, if any harm was realised any effects would be *mild.*
Very Low Risk	The presence of an identified hazard does not give rise to the potential to cause harm to a designated receptor.

The term 'risk' in this instance refers to the risk that the source, pathway, receptor linkage for a given source of contamination is complete. It does not refer to immediate risk to individuals or features present on the site from potential contaminants and is intended to be used as a tool to assess the necessity of further investigation.
