ARTIFICIAL LEISURE GRASS SUB BASE WITH SHOCK-PAD

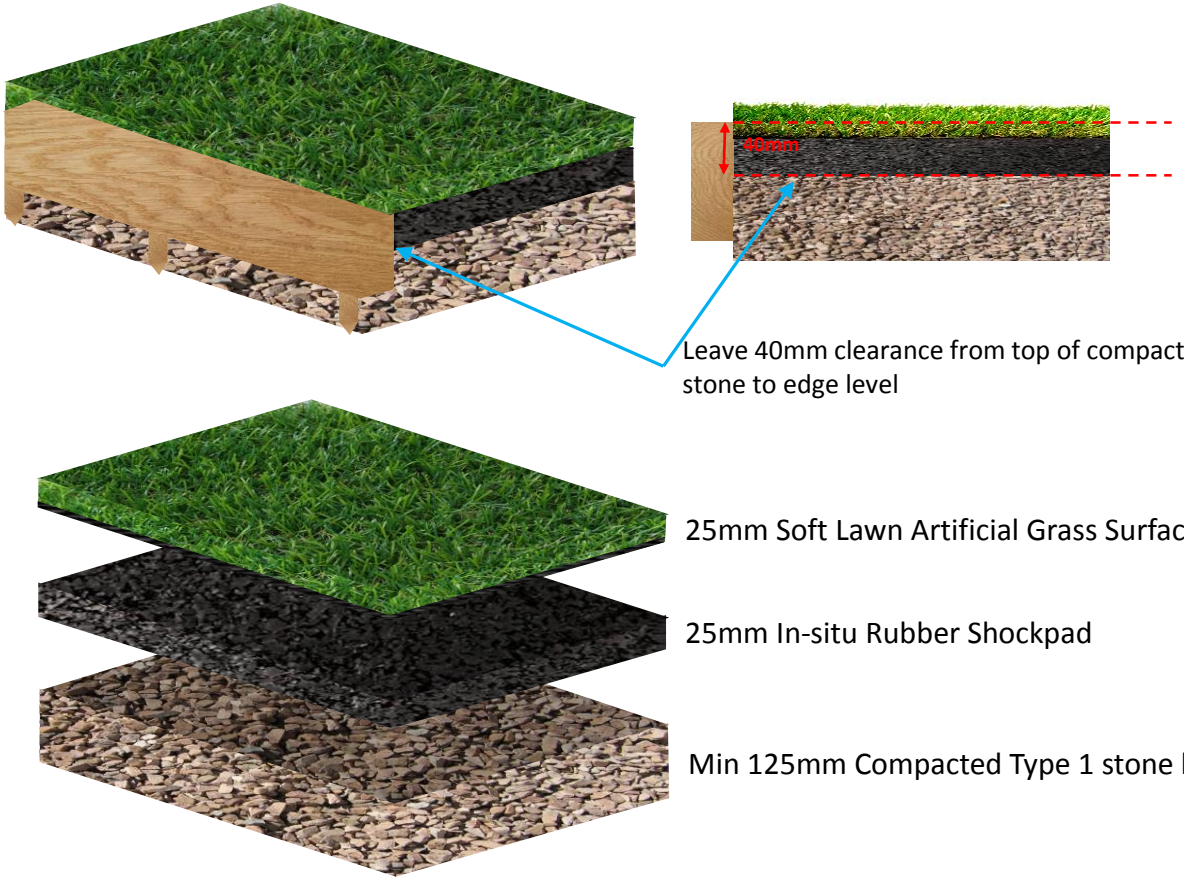

Artificial Grass Sub Base with Shcok-pad

The sub base for artificial grass can vary considerably depending on the ground conditions to the project.

This diagram shows the make-up using an in-situ laid SBR Rubber shockpad.

The Shockpad is installed to give a smooth level surface for the leisure grass to be installed onto. This aids site drainage as it is porous as well as improving safety and characteristics of the area.

Timber edges are installed to the perimeter of the area and the leisure grass can be either installed upto the edge or in some cases is tucked over the timber edge and pinned to the outside.
