

Italia-80 Cladding & Screening

Italia-80 is a steel louvred cladding system which combines 80% visual screening with 36% free area for ventilation. The steel construction creates a robust panel suitable for ground and street-front locations as well as roof-top and elevated situations.

The louvre profile is formed from three times flanged 50×1.5 mm flat bars which are spaced 9mm apart and form a continuous linear aesthetic. The louvres are secured by electrofusion to 4mm diameter vertical round bars.

Framed panels are made to custom-sizes and are nestled together to create a screen of any height for a wide variety of applications such as wall cladding, car park screens, compounds, plant housing, ventilation grilles, balconies and balustrades, wheelie bin stores and brise soleil.

Max Panel Height: 1963mm
Standard Panel Widths: 1725mm and 1991mm

Panels and ancillary steelwork can be supplied galvanized only or galvanized and powder coated to any RAL colour.
