Labelling and Numbering

In view of the complete lack of symmetry in the dome, each panel will be labelled with a unique reference that corresponds precisely to its original location. This is essential, as the irregular geometry means the panels are not interchangeable and will only fit in the positions they were originally installed.

Each panel of the dome will be carefully removed one by one during the full survey, with precise templating carried out to record its exact shape, size, and curvature. This template will also carry additional information such as the location of saddle bars.

As each panel is taken down, it will be assigned a unique reference number and its position logged on a master layout drawing to ensure accurate tracking. This systematic approach allows for detailed analysis of the existing condition of each unit and ensures that every panel can be reinstated in its original location.

As part of the manufacturing process these references will then be added to a program called 'Monday', where each panel can be tracked individually throughout the restoration process. This system will allow the team to monitor the condition, location, and progress of each panel—from removal to reinstatement ensuring full traceability.
