Mortar Design Statement

We reviewed chasing out mortar joints during design development, and decided not to proceed with this approach because we were looking for the ‘block’ of brickwork to sit in clear contrast to the pattern of insets and windows that make up the facade. This will be more strongly expressed with a flush mortar joint that allows the shadows of the insets and the dark framing to be dominant and more powerful, particularly on the upper brook street elevation.

By using a multi brick we keep a subtle level of brick by brick variation across both blocks, alongside the primary move of the pattern of brickwork insets that move up the facade.

The Kincardine Road block uses the same metalwork colours but the warmer brick tone used here reduces the contrast and is therefore less strident and more appropriate to the residential setting.
