Executive summary

Cundall has been commissioned by Watson Construction Ltd to undertake a series of acoustic commissioning tests to assist with discharging a planning condition at a new residential development at 123 Levenshulme Road, Gorton, Manchester.

The wording of the planning conditions, to which this report pertains, states:

"The report shall also undertake post completion testing to confirm that the internal noise criteria have been met. Any instances of non-conformity with the recommendations in the report shall be detailed along with any measures required to ensure compliance with the internal noise criteria."

Accordingly, noise monitoring has been undertaken within the living rooms and one bedroom of four out of the 37 new dwellings on the site.

The four plots selected for testing are considered to be representative of the various sources of noise affecting the site and of the differing ventilation strategies adopted across the development.

The initial results of the post-completion noise monitoring exercise identified that internal ambient noise levels were higher than the internal noise criteria adopted by Manchester City Council.

However, in all cases, the noise monitoring was undertaken in rooms that were practically complete but unfurnished (including floor coverings).

Calculations presented within this report demonstrate the typical reduction of the internal ambient noise levels that can be expected once the rooms receive a final floor finish and include typical soft furnishings.

Once furnished, internal ambient noise levels are expected to comply with the MCC internal noise criteria in all spaces with minor exceptions in Bedroom 1 of Plot 1 and the Bedroom of Plot 20.

In these latter cases, additional mitigation measures have been recommended to reduce internal noise break-out from the MVHR units installed within the dwellings.

The mitigation measured recommended herein are deemed to be sufficient to reduce the measured internal ambient noise levels to within the thresholds of the MCC internal noise criteria.

Maximum noise levels in Bedrooms at night demonstrate that individual noise events do not typically exceed 45 dB $L_{Amax,F}$ by more than 10 times per night across the development. Whilst the results of the post completion tests do report a higher number of exceedances within the Bedroom of Plot 1, these are not considered to be typical when compared to the measured maximum noise levels in all other spaces.

The evidence contained within this report is therefore considered suitable to demonstrate compliance with the MCC internal noise level criteria, either as a direct result of the post-completion testing, or through adoption of mitigation measures.

1.0

Introduction

1.0 Introduction

1.1 Overview

Cundall has been commissioned by Watson Construction Ltd to undertake a series of acoustic commissioning tests to assist with discharging a planning condition at a new residential development at 123 Levenshulme Road, Gorton, Manchester.

The planning condition requires evidence that noise mitigation measures at the pre-construction stage have been implemented and internal noise levels be measured to demonstrate compliance with the Manchester City Council noise guidance.

The development comprises six semi-detached 2-bed houses and a 3-storey apartment block containing 31 1- and 2-bed dwellings, as indicated in Figure 1-1, below.

Figure 1-1: Site layout

1.2 Purpose of Report

This report provides details of noise surveys undertaken within a number of the new dwellings to demonstrate compliance with Condition number 11b of the consented development

2.0

Condition requirements

2.0 Condition requirements

2.1 Condition wording

Planning application reference 135270/FO/2022 was submitted in November 2022 and approved in February 2023 for:

Erection of 6 x 2 storey dwellinghouses and 3 storey building to form 31 apartments (Class C3) together with parking, access road, landscaping and boundary treatment

Within the decision notice for the consented scheme, the following planning condition was included that references internal noise levels within the dwellings:

11) a) Before the commencement of any above ground works , a scheme for acoustically insulating the proposed residential accommodation against noise from the railway line situated to the east of the site shall be submitted to and approved in writing by the City Council as local planning authority. There may be other actual or potential sources of noise which require consideration on or near the site, including any local commercial/industrial premises such as retail shops on Levenshulme Road. The approved noise insulation and ventilation scheme shall be completed before any of the dwelling units are occupied.

Noise survey data shall include measurements taken during a rush-hour period and night-time to determine the appropriate sound insulation measures necessary.

Due to the proximity of the development to the railway line it will be necessary for vibration criteria to apply which can be found in BS 6472: 2008 "Guide to evaluation of human exposure to vibration in buildings". Groundborne noise/re-radiated noise shall also be factored into the assessment and design.

b) Prior to first occupation of the residential units, a verification report shall be required to validate that the work undertaken throughout the development conforms to the recommendations and requirements in the approved acoustic consultant's report. The report shall also undertake post completion testing to confirm that the internal noise criteria have been met. Any instances of non-conformity with the recommendations in the report shall be detailed along with any measures required to ensure compliance with the internal noise criteria.

Reason- To secure a reduction in noise from traffic or other sources in order to protect future residents from noise disturbance, pursuant to policies SP1 and DM1 of the Manchester Core Strategy (2012), and saved UDP policy DC26.

2.2 Condition 11)a) discharge

An application was submitted in April 2024 (reference CDN/24/0268) and approved in June 2024 to discharge a number of the planning conditions for the original application, including partial discharge of condition 11.

Submitted with this application was a Noise and Vibration Impact Assessment Report, prepared by OMNIA, reference C10764/NIA/1.1, July 2024, which included details of the proposed sound insulation scheme for the development.

The decision notice, dated 7 June 2024, confirmed that condition number 11)a) was discharged.

2.3 Condition 11)b) discharge

Cundall have been appointed to undertake the post-completion noise testing and have had no previous involvement in the development of the scheme.

Full validation that works undertaken throughout the development conform to the recommendations and requirements in the approved acoustic consultant's report will therefore be the responsibility of the main contractor.

This report provides details and results of the post completion testing of internal noise levels and any associated mitigation measures required to ensure compliance with the internal noise criteria.

2.4 Manchester City Council - Planning and Noise Technical Guidance 2022

The MCC PNTG document provides guidance to applicants and consultants concerning the assessment and prediction of environmental noise associated with a particular development guidance.

Section 3.7.1.1 of the guidance document sets out the Council's noise level design targets for residential developments and states:

The Council has adopted the following noise limits for residential properties:

- *Bedrooms (night time - 23.00 - 07.00) 30 dB L_{Aeq} (individual noise events should not normally exceed 45 dB $L_{Amax,F}$ by more than 10 times)*
- *Living Rooms (daytime - 07.00 - 23.00) 35 dB L_{Aeq}*
- *Gardens and terraces (daytime) 55 dB L_{Aeq}*

These criteria have been adopted for the following reasons:

- *BS 8233: 2014 recognises these levels as a good standard for resting/sleeping conditions.*
- *The WHO document 'Guidelines for Community Noise' recommends an internal L_{Aeq} of 30dB for optimal sleep conditions (and no more than 35dB for internal rooms during daytime).*
- *The performance of acoustic insulation schemes can often be below that specified, according to the quality of installation, materials, noise spectrum and deterioration / wear and tear of building elements. A high design specification introduces a 'safety margin' should building elements not perform as well as expected ('on-site' performance).*
- *Performance specification for glazing does not usually take into account the detrimental effect of vents on the sound insulation. Even 'acoustic' vents will reduce the performance of the facade insulation, as they will inherently contain a free open area for air exchange.*
- *There is a general increase in urban noise levels, which can in the future be reasonably accommodated by these standards.*
- *The standards support the Local Authority corporate objective to prevent ill-health and improve local peoples' health and well being*

3.0

Post completion test methodology

3.0 Post completion test methodology

3.1 Quantum of tests

The development comprises a total of 37 new dwellings, including six 2-storey semi-detached houses and 31 apartments.

In previous correspondences, MCC have stipulated that they expect noise monitoring to be undertaken within 10% of the dwellings and with at least one living room and one bedroom being tested in each dwelling.

Accordingly, Cundall have undertaken internal noise level testing in the main Living room (either a dedicated living room or an open plan Kitchen/Dining/Living space) and the main Bedroom within four dwellings.

3.2 Duration of tests

All noise monitoring has been undertaken over a period of circa 24-hours in each room/dwelling.

Noise monitoring in both rooms within a dwelling have been undertaken simultaneously.

Noise monitoring in each dwelling has been undertaken consecutively over multiple days.

3.3 Measurement positions

The following monitoring locations have been selected, and indicated on the layout plans included in Appendix A:

3.3.1 Plot 1

Plots 1 and 2 are considered to be equally exposed to road traffic noise from Levenshulme Road and were both subject to the highest mitigation requirements in the pre-planning noise impact assessment report (OMNIA). Testing in Plot 1 is therefore considered to be representative of the noise levels within both Plots 1 and Plot 2 of the development.

Testing has been undertaken in the ground floor Living Room and in Bedroom 1 on the first floor, both of which have windows directly exposed to road traffic on Levenshulme Road.

3.3.2 Plot 5

Plots 3 to 6 are all positioned equidistant from the railway lines running past the north-east boundary of the site. Therefore, testing within any of these four houses is considered to be equally representative of railway noise in any of these other houses.

Plots 4 and 5 both have ground floor living rooms and first floor bedrooms with two external façades, one facing the railway lines and the other facing south-west, towards Levenshulme Road. Of these, the south-east façade of Plot 5 is marginally more exposed to road traffic on Levenshulme Road.

Testing has therefore been undertaken in the ground floor Living Room and in Bedroom 1 on the first floor of Plot 5 which are expected to be subject to the highest noise exposure from road and railway noise relative to Plots 3 to 6.

3.3.3 Plot 19

All plots along the south-west side of the apartment block have a different ventilation strategy to the rest of the development, incorporating trickle vents and mechanical extract ventilation.

Whilst screened from railway noise, the review of the original noise impact assessment report indicates that the plots along the south-west side of the apartment block are subjected to the highest levels of commercial noise from the existing retail units on Levenshulme Road.

Plots 8, 13 and 19 are each located on the northern end of the apartment block on the Ground, First and Second floors, respectively, and therefore have two external façades (to their Living/Kitchen/Dining rooms). The north-west façade of the Living/Kitchen/Dining rooms in these plots will therefore be partially exposed to railway noise. Similarly, these plots are the closest to the rear of the retail units on Levenshulme Road.

Testing has therefore been undertaken in the Living/Kitchen/Dining and the Bedroom of Plot 19, on the second floor, which are expected to be a worst-case representation of all Plots along the south-west side of the apartment block.

3.3.4 Plot 20

All plots along the north-east side of the apartment block all equidistant from the railway lines running past the boundary of the site.

Plots 9, 14 and 20 are each located on the northern end of the apartment block on the Ground, First and Second floors, respectively, and therefore have two external façades (to their Living/Kitchen/Dining rooms), and are expected to be subjected to marginally higher break-in noise compared to other Plots along the north-east side of the apartment block.

Plot 20 is located on the second floor of the apartment block and is therefore more exposed to railway noise as there is no acoustic screening afforded by the fencing along the site boundary.

Testing has therefore been undertaken in the Living/Kitchen/Dining and the Bedroom of Plot 20, on the second floor, which are expected to be a worst-case representation of all Plots along the north-east side of the apartment block.

3.3.5 General

In all cases, the microphones were positioned in the centre of the rooms and approximately 1.5m above floor level.

Photographs of all monitoring positions are included in Appendix B

3.4 Monitoring conditions

In all cases, noise monitoring was undertaken with windows to the rooms closed.

All internal doors in the rooms being monitored were closed.

Where an MVHR ventilation strategy is incorporated into the dwellings, the MVHR units were switched on and operating at normal duty.

Where a continuous MEV ventilation strategy is incorporated into the dwellings, the MEV system was switched on and operating at normal duty. Additionally, all trickle vents in the rooms being tested were set to the open position.

3.5 Monitoring equipment

Noise measurements were made using CEL-633 and NTi-XL2 Class 1 sound level meters both in accordance with BS 7445-1:2003. The meters were field-calibrated before and after each noise survey period to ensure a consistent and acceptable level of accuracy was maintained throughout. No significant drift was observed.

Equipment	Manufacturer & Model	Serial number
Sound level meter(s)	Casella CEL-633 Casella CEL-633 NTi-XL2	1211404 1211405 A2A-16315-E0
Calibrator(s)	Casella 120/1 Casella 120/1 Larson Davis CAL200	3574169 4921893 16781

Table 3-1: Noise monitoring equipment

Calibration certificates for all monitoring equipment are available on request.

3.6 Weather monitoring

Weather conditions were monitored for the full duration of the surveys.

Wind speeds were below 5 m/s for both full survey period and temperatures averaged 14 ºC during the day and 11 ºC at night for the surveys in early June and circa 5 degrees warmer during the surveys at the end of June.

There were brief spells of heavy rainfall around 14:30 on 5 June but otherwise conditions were generally dry throughout for both survey periods.

The weather conditions are deemed to be typical and unlikely to have any adverse impact on the internal noise levels measured.

3.7 Key noise sources

3.7.1 Road traffic

For dwellings/rooms with a south-west elevation, the dominant noise source was perceived to be road traffic from Levenshulme Road.

There was a period of roadworks being carried out at the junction of Levenshulme Road and the site access road commencing on 9/10 June. These works were undertaken during the daytime only but the survey locations were co-ordinated so that measurements in Plot 1, directly overlooking the works, were avoided.

3.7.2 Railway movements

For dwellings/rooms with a north-west elevation, the dominant noise source was from train movements along the railway lines just beyond the site boundary.

A full log of available rail movements is included in Appendix C

3.7.3 Commercial noise

The Noise and Vibration Impact Assessment Report, submitted to discharge condition 11)a), made reference to commercial noise from ventilation plant at the rear of the retail units on Levenshulme Road.

During attended periods of the survey, commercial noise was not deemed to be clearly perceptible over the general ambient noise environment. If there were any periods in which commercial noise from these premises would have caused adverse impact, it is expected that it would be clearly distinguishable within the survey results for the rooms tested in Plots 5 and 19, which have a direct line of sight to this plant.

3.7.4 Internal mechanical ventilation

All plots on the development site include either MVHR or MEV mechanical ventilation systems.

The mechanical units are located in utility cupboards, typically located off a hallway. However, in Plots 1 and 2, the MVHR unit is housed within a cupboard that opens directly into a bedroom.

Noise levels associated with the MVHR or MEV systems, in the rooms in which they provide/extract air from were just perceptible. Noise levels from the units themselves were perceptible in the spaces directly outside the cupboards containing them.

4.0

Results

4.0 Results

The following sub-sections summarise the overall noise levels measured within each of the tested dwellings/rooms. Full time history plots are presented in Appendix D of this report.

4.1 Plot 1

The results in Table 4-1, below were measured between 5-6 June 2025 in the Ground Floor Living Room and between 30 June to 1 July in the First Floor Bedroom 1.

Parameter	Living Room	Bedroom 1
Daytime $L_{Aeq,16hr}$ (07:00 – 23:00 hrs)	35	40
Night-time $L_{Aeq,8hr}$ (23:00 – 07:00 hrs)	35	37
Highest Night-time $L_{AmaxF,1min}$ (23:00 – 07:00 hrs)	n/a	59
Number of Night-time exceedances over 45 dB $L_{AmaxF,5min}$	n/a	39

Table 4-1: Survey results - Plot 1

The initial results indicate that ambient noise levels within the Living Room comply with MCC requirements.

Ambient noise levels in the Bedroom indicate an exceedance of the MCC criteria, however, further mitigation of these levels are anticipated once rooms are complete and furnished. Such mitigation is discussed in Section 5.1 of this report.

Maximum noise levels at night, in the Bedroom, were found to exceed 45 dB $L_{AmaxF,5min}$ on 39 occasions, with maximum levels of up to 59 dB $L_{AmaxF,5min}$. A review of the time history plots indicates that all exceedances over 50 dB $L_{AmaxF,5min}$ occurred in the periods between 23:00 – 00:30 and 06:00 – 07:00 hours. Thereafter, the maximum $L_{AmaxF,5min}$ level measured between 00:30 – 06:00 hours, was 48 dB $L_{AmaxF,5min}$.

Whilst the cause of these exceedances cannot specifically be determined, audio captures from some of the other monitoring positions have identified several other L_{AmaxF} noise levels being attributed to unsocial driving behaviour (loud, popping exhaust pipes) and would not be deemed to be 'normal'.

As the survey has been undertaken over a single night-time period, the number of 45 dB $L_{AmaxF,5min}$ exceedances recorded on this occasion does not demonstrate that individual noise events do not *normally* exceed 45 dB $L_{Amax,F}$ by more than 10 times, as stated in the planning condition. Analysis of the Plot 1 Living Room survey results, which is equally exposed to Levenshulme Road (the most likely source of the L_{AmaxF} noise levels), demonstrates that 45 dB $L_{AmaxF,5min}$ is only exceeded on 5 occurrences.

4.2 Plot 5

The results in Table 4-2, below were measured over a weekend period between 6 - 9 June 2025 in the Ground Floor Living/Kitchen/Dining Room and First Floor Bedroom 1. The results presented are the logarithmic average of the day and night-time ambient levels, the maximum overall $L_{AmaxF,5min}$ level, and the average count of 45 dB $L_{AmaxF,5min}$ exceedances.

Parameter	Living/Kitchen/Dining Room	Bedroom 1
Daytime $L_{Aeq,16hr}$ (07:00 – 23:00 hrs)	38	35
Night-time $L_{Aeq,8hr}$ (23:00 – 07:00 hrs)	38	34
Highest Night-time $L_{AmaxF,1min}$ (23:00 – 07:00 hrs)	n/a	55
Number of Night-time exceedances over 45 dB $L_{AmaxF,5min}$	n/a	9 (average per night)

Table 4-2: Survey results - Plot 5

The initial results indicate that ambient noise levels within the Living/Kitchen/Dining Room and Bedroom 1 exceed the MCC criteria, however, further mitigation of these levels are anticipated once rooms are complete and furnished. Such mitigation is discussed in Section 5.1 of this report.

Whilst the highest recoded L_{AmaxF} in the Bedroom at night-time was 55 dB $L_{AmaxF,5min}$, there were only 26 individual events that exceeded 45 dB $L_{AmaxF,5min}$ over the course of the three nights surveyed. Furthermore, the majority of the $L_{AmaxF,5min}$ levels recorded were below 40 dB. This demonstrates that individual noise events do not normally exceed 45 dB $L_{Amax,F}$ by more than 10 times.

4.3 Plot 19

The results in Table 4-3, below were measured between 9 - 10 June 2025 in the Living/Kitchen/Dining Room and between 26 – 27 June in the Bedroom.

Parameter	Living/Kitchen/Dining Room	Bedroom
Daytime $L_{Aeq,16hr}$ (07:00 – 23:00 hrs)	38	36
Night-time $L_{Aeq,8hr}$ (23:00 – 07:00 hrs)	38	35
Highest Night-time $L_{AmaxF,1min}$ (23:00 – 07:00 hrs)	n/a	58
Number of Night-time exceedances over 45 dB $L_{AmaxF,5min}$	n/a	8

Table 4-3: Survey results - Plot 19

The initial results indicate that ambient noise levels within the Living/Kitchen/Dining Room and Bedroom exceed the MCC criteria, however, further mitigation of these levels are anticipated once rooms are complete and furnished. Such mitigation is discussed in Section 5.1 of this report.

Whilst the highest recoded L_{AmaxF} in the Bedroom at night-time was 58 dB $L_{AmaxF,5min}$, there were only 8 individual events that exceeded 45 dB $L_{AmaxF,5min}$ and the majority of the maximum levels were below 40 dB $L_{AmaxF,5min}$. This is a positive indication that individual noise events would not normally exceed 45 dB $L_{Amax,F}$ by more than 10 times.

4.4 Plot 20

The results in Table 4-4, below were measured over a weekend period between 27 - 30 June 2025 in the Living/Kitchen/Dining Room and Bedroom. The results presented are the logarithmic average of the day and night-time ambient levels, the maximum overall $L_{AmaxF,5min}$ level, and the average count of 45 dB $L_{AmaxF,5min}$ exceedances.

Parameter	Living/Kitchen/Dining Room	Bedroom 1
Daytime $L_{Aeq,16hr}$ (07:00 – 23:00 hrs)	34	38
Night-time $L_{Aeq,8hr}$ (23:00 – 07:00 hrs)	38	38
Highest Night-time $L_{AmaxF,1min}$ (23:00 – 07:00 hrs)	n/a	59
Number of Night-time exceedances over 45 dB $L_{AmaxF,5min}$	n/a	8

Table 4-4: Survey results - Plot 20

The initial results indicate that ambient noise levels within the Living/Kitchen/Dining Room comply with MCC requirements.

Analysis of the time-history plot for the Living/Kitchen/Dining indicates a period between 00:00 and 03:00 on the third (Sunday) night of monitoring when the ambient noise levels are circa 10 dB higher than normal (relative to the rest of that night-time period and those for the other nights monitored). These results are included in the overall ambient noise levels presented above (38 dB $L_{Aeq,8hr}$), however, if this specific period were to be omitted as an abnormality, the resultant overall night-time ambient level in the Living/Kitchen/Dining would be 32 dB $L_{Aeq,T}$.

Ambient noise levels in the Bedroom indicate an exceedance of the MCC criteria during the day and night-time periods, however, further mitigation of these levels are anticipated once rooms are complete and furnished. Such mitigation is discussed in Section 5.1 of this report

Whilst the highest recoded L_{AmaxF} in the Bedroom at night-time was 59 dB $L_{AmaxF,5min}$, there were only 24 individual events that exceeded 45 dB $L_{AmaxF,5min}$ over the course of the three nights surveyed. Furthermore, the majority of the $L_{AmaxF,5min}$ levels recorded were circa 40-42 dB. This demonstrates that individual noise events do not normally exceed 45 dB $L_{Amax,F}$ by more than 10 times.

5.0

Additional mitigation

5.0 Additional mitigation

5.1 Corrections for room finishes

All rooms in which tests were undertaken were complete but did not include any floor finishes. The exposed floors were screed topped slabs allowing future tenants to install their choice of flooring.

It can reasonably be assumed that bedrooms and living rooms would be finished with a carpet floor finish. Such a soft floor covering would reduce the reverberation time in these rooms and hence result in lower reverberant noise levels from external intrusion.

For living/kitchen/dining rooms it is assumed that vinyl or laminate floorings would be installed, whilst these would add less additional absorption than a carpet finish, additional soft furnishings, such as sofas, would also introduce additional acoustic absorption.

Calculations are presented in Appendix E that demonstrate that once furnished, the internal reverberant noise levels would likely reduce by:

- 6 dBA in bedrooms and living rooms
- 3 dBA in living/kitchen/dining rooms

Therefore, the results presented in Section 4.0 can be adjusted accordingly, resulting in the following internal ambient noise levels.

Plot/Room	Measured daytime $L_{Aeq,16hr}$ (07:00 – 23:00 hrs)	Measured night-time $L_{Aeq,8hr}$ (23:00 – 07:00 hrs)	Correction for room furnishings	Furnished daytime $L_{Aeq,16hr}$ (07:00 – 23:00 hrs)	Furnished night-time $L_{Aeq,8hr}$ (23:00 – 07:00 hrs)
Plot 1 Living Room	35	35	-6 dBA	**29** (*complies with MCC requirement*)	29
Plot 1 Bedroom 1	40	37	-6 dBA	34	**31** (*marginal exceedance of MCC requirement*)
Plot 5 Living/Kitchen	38	38	-3 dBA	**35** (*complies with MCC requirement*)	35
Plot 5 Bedroom 1	35	34	-6 dBA	29	**28** (*complies with MCC requirement*)
Plot 19 Living/Kitchen	38	38	-3 dBA	**35** (*complies with MCC requirement*)	35
Plot 19 Bedroom	36	35	-6 dBA	30	**29** (*complies with MCC requirement*)
Plot 20 Living/Kitchen	34	31	-3 dBA	**31** (*complies with MCC requirement*)	28
Plot 20 Bedroom	38	38	-6 dBA	32	**32** (*marginal exceedance of MCC requirement*)

Table 5-1: Corrected ambient noise levels for furnished rooms

The resultant internal ambient noise levels, once all dwellings are furnished, indicate that most rooms will then comply with the requirements of the MCC Planning and Noise Technical Guidance 2022.

Minor exceedances of the MMC internal noise criteria remain possible in the Bedrooms of Plot 1 and Plot 20.

Based on observations made whilst on site, the noise levels in these rooms were perceived to be influenced by the MVHR units installed within the dwellings. Additional mitigation measures to reduce MVHR noise are discussed in the following sub-section.

5.2 MHVR casing noise levels

5.2.1 Plot 1 – Bedroom 1

With Bedroom 1 of Plot 1, noise levels were perceived to be radiating from the casing of the MVHR unit within the cupboard located in the Bedroom. These noise levels within the cupboard are not adequately insulated by the cupboard door alone.

It is therefore recommended that the MVHR unit (casing and ductwork) are enclosed within the cupboard. A secondary enclosure, as indicated below in Figure 5-1, formed of a single layer of plasterboard, plywood, MDF or similar, with a mass of at least 10 kg/m^2 and lined internally (facing the MVHR unit) with a 25mm tissue faced mineral wool or foam material, would reduce the noise levels within the cupboard space by at least 3 dBA.

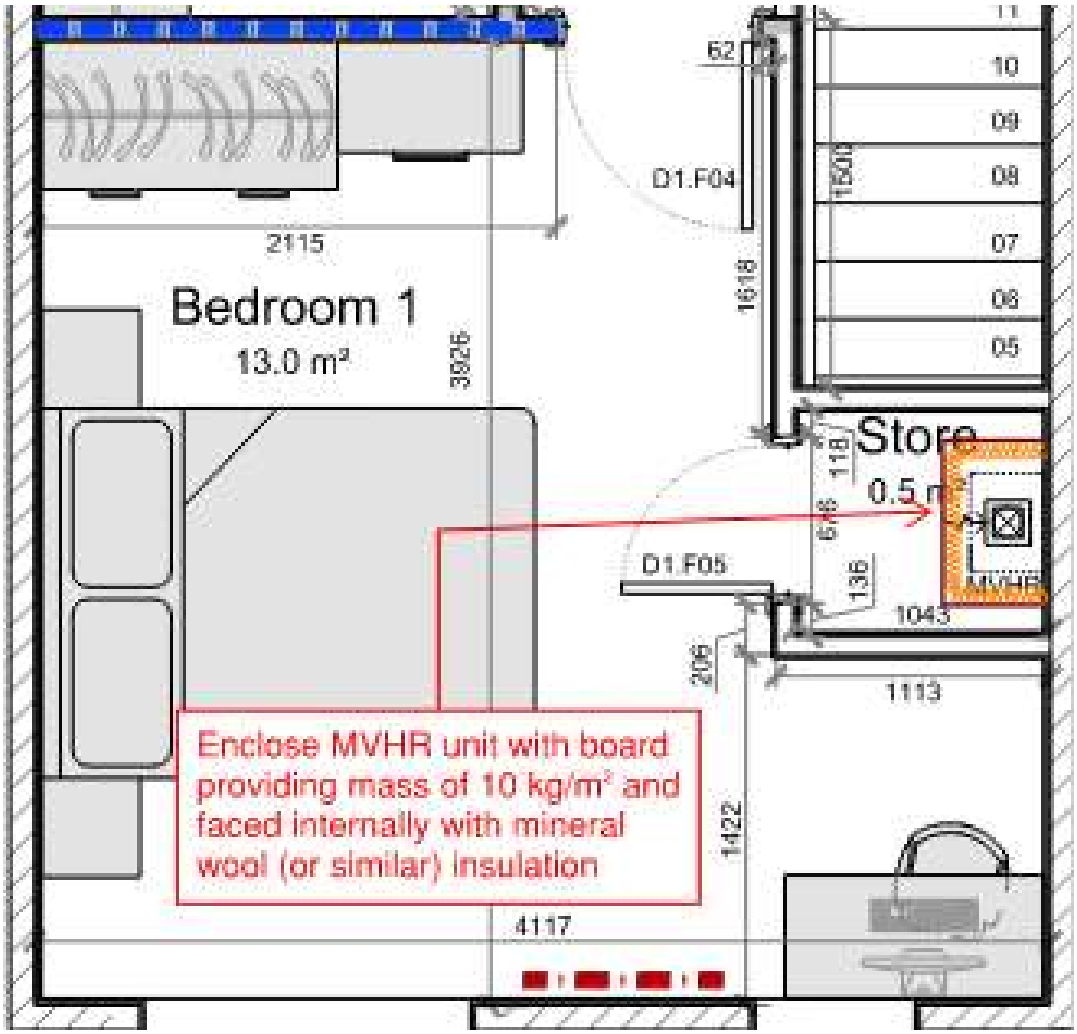

Figure 5-1: Noise mitigation to Plot 1 MVHR unit

Accordingly, this would reduce the ambient night-time noise level in the Bedroom, once furnished, to **< 28 dB $L_{Aeq,8hr}$,** and be compliant with the MCC internal noise limit.

Whilst this issue has been evidenced in Bedroom 1 of Plot 1, the layout plans indicate that the same arrangement, of an MVHR unit located within a cupboard accessible from the Bedroom, also occurs in Plots 2, 3 and 6. The additional mitigation measures recommended above should be applied to all four rooms/Plots.

5.2.2 Plot 20 - Bedroom

With the Bedroom of Plot 20, noise levels were perceived to be transmitted from the internal wall of the Bedroom against which the MVHR unit was installed on the opposite side. It is believed that this is structure-borne noise transmission due to the mechanical fixing of the MVHR unit to the common partition.

It is therefore recommended that the MVHR unit is structurally isolated from the partition with the Bedroom. This could either be achieved by means of an independent frame fixed to the floor/ceiling of the store room, or by relocating the MVHR unit to the adjacent wall of the store room, as indicated in Figure 5-2, below.

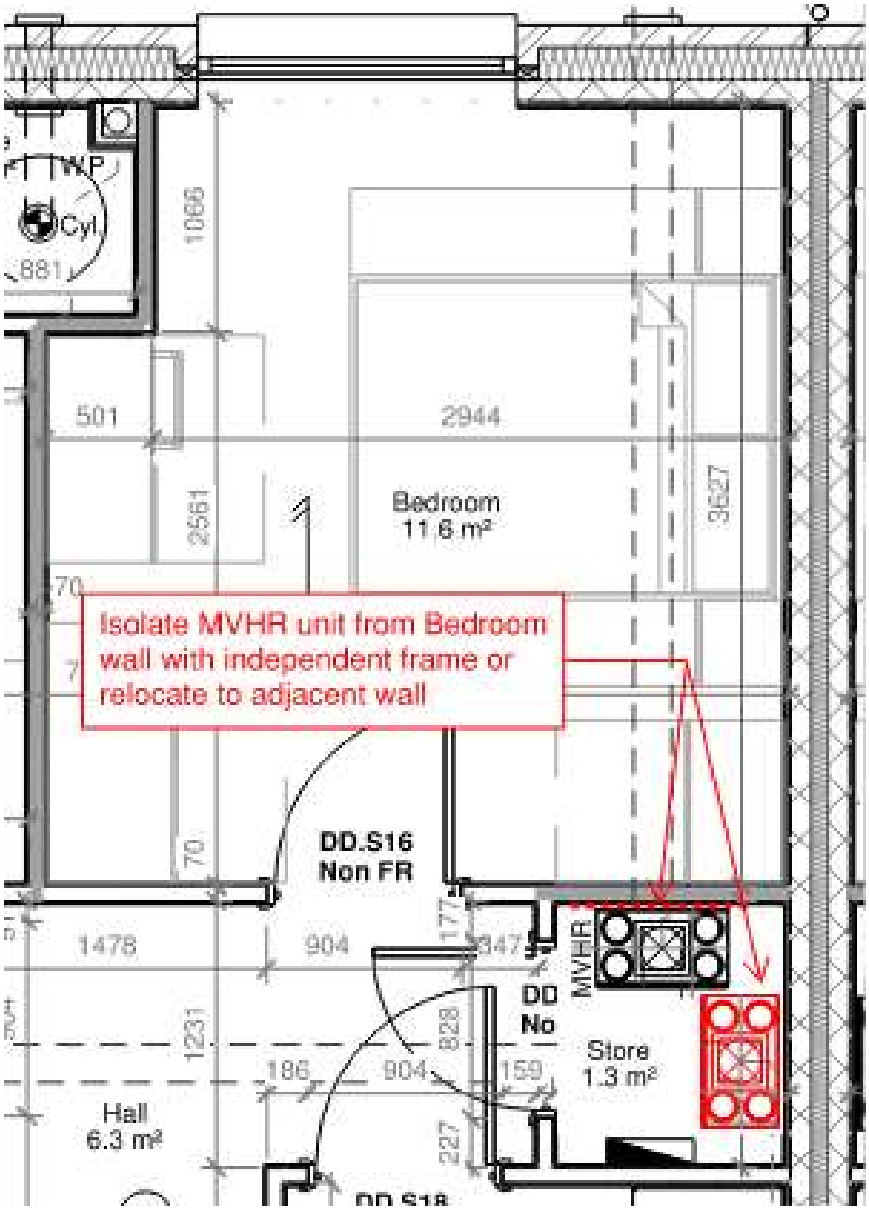

Figure 5-2: Noise mitigation to Plot 20 MVHR unit

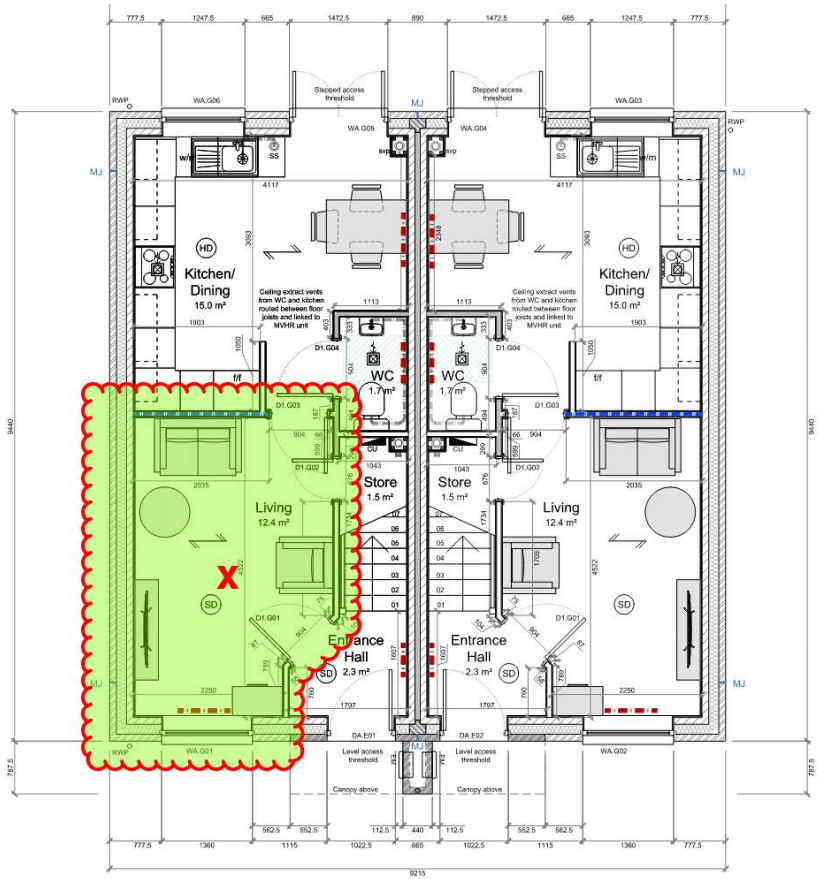

Eliminating the structure-borne noise component from the MVHR unit is expected to result in a noticeable reduction to the ambient noise level in the Bedroom, such that once furnished, they will be **< 30 dB $L_{Aeq,8hr}$**, and compliant with the MCC internal noise limit.

Whilst this issue has been evidenced in the Bedroom of Plot 20, the layout plans indicate that the same arrangement, of an MVHR unit located within a cupboard accessible from the Bedroom, also occurs in Plots 9, 10, 25, 14, 15, 29, 21, and 34. The additional mitigation measures recommended above should be applied to all nine of these rooms/Plots.

Appendices

Appendix A Floor plans

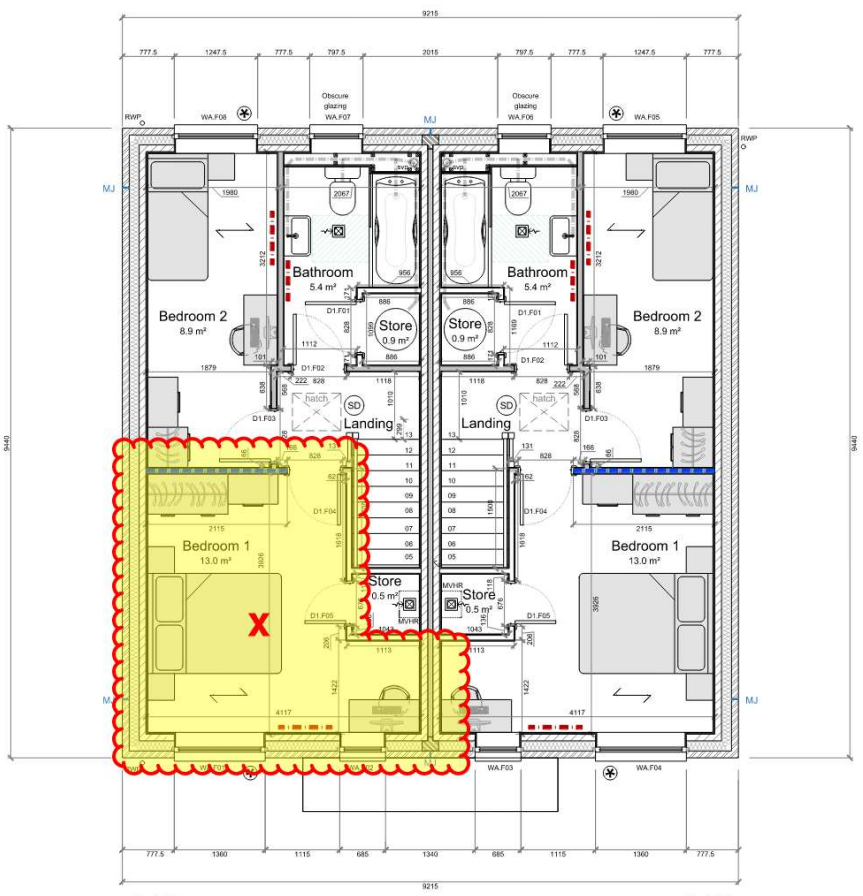

PLOT 1 (House Type 1)
2 Bedroom 3 Person House
GF Area: 35.2m²
FF Area: 35.2m²
Total : 70.4m²
Ground Floor FFL: 66.50

PLOT 2 (House Type 1)
2 Bedroom 3 Person House
GF Area: 35.4m²
FF Area: 35.4m²
Total : 70.8m²
Ground Floor FFL: 66.50

Appendix E Reverberant noise level corrections

Corrections for room furnishings

Item / Description		Broadband dB	Octave Band Centre Frequency, Hz 125	250	500	1k	2k	4k
Outside to inside noise transmission:	**Lp,*rev* = Lp,*ext* + TL + 10 x Log(S) - 10 x Log (A) + D**							
Where:	Lp,*rev* = internal reverberant noise level							
	Lp,*ext* = external noise level							
	TL = façade sound insulation							
	S = surface area of façade							
	A = internal room absorption							
	D = diffuse field correction: 6 for low absorption, 3 for medium-high absorption							
Therefore, when Lp,*ext*, TL, and S are all constant, the internal reverberant noise level (Lp,*rev*) will change with different levels of absorption (A) and diffuse field (D) correction in the room								
Bedrooms and Living Rooms:								
For unfurnished bedroom/living room, D = 6 and A(u) =			8	6	4	2	3	4
For carpeted bedroom/living room, D = 3 and A(c) =			9	7	7	10	12	13
{10 Log A(u) + D} - {10 Log A(c) +D}			3	4	6	9	10	8
Typical measured internal reverberant noise level in unfinished room		34 (A)	34	40	29	25	20	18
Predicted internal reverberant noise level in room furnished with carpet		29 (A)	30	37	23	16	10	9
Typical future reduction:		**6**						
Kitchen / Living / Dining Rooms								
For unfurnished kitchen/living/dining room, D = 6 and A(u) =			13	9	6	4	4	6
For furnished living/kitchen/dining room, D = 6 and A(c) =			16	14	12	10	11	13
{10 Log A(u) + D} - {10 Log A(c) +D}			1	2	3	4	4	3
Typical measured internal reverberant noise level in unfinished room		38 (A)	35	41	36	32	28	26
Predicted internal reverberant noise level in room furnished with carpet		35 (A)	34	39	33	27	23	23
Typical future reduction:		**3 (A)**
