Notes

© This drawing and the building works depicted are the copyright of RPS and may not be reproduced or amended except by written permission. No liability will be accepted for amendments made by other persons.

The Contractor is to check and verify all building and site dimensions, levels and sewer invert levels at connection points before work starts. Any discrepancies are to be reported to RPS. All relevant Statutory Legislation, British Standard Specifications, Building Regulations, Construction (Design & Management) Regulations, Party Wall Act, etc. whether or not specifically stated on this drawing. This drawing must be read with and checked against any structural, geotechnical or other specialist documentation provided.

This drawing is not intended to show details of foundations, ground conditions or ground contaminants. Any indication of foundations is approximate only and based on visible evidence. Ground conditions are investigated by the Contractor; a suitable method of foundation should be 'grounded' allowing for existing ground conditions. Any suspect or fluid ground, contaminates on or within the ground, should be further investigated by a suitable expert. Any trees or vegetation shown indicate typical species for guidance only & should be further investigated by a suitable expert.

Where existing trees are to be retained they should be subject to a full Arboricultural inspection for safety, health & stability. Trees should be protected during construction works and adequate root protection zones from drainage and services. A suitable method of foundation is to be provided to accommodate the proposed tree planting. All tree types are provided as a guide only and a full Arboricultural survey to be conducted to determine the exact tree types should be Completed.

Sketch proposals are for illustrative purposes only & as such are subject to detailed site investigation and design. Where proposals are based upon OS mapping, RPS cannot guarantee the accuracy of the mapping. Where proposals may be based upon enlargements of OS sheets & visual estimation of existing site features, accuracy will therefore need to be verified by survey. Sketch proposals have not been considered by the Local Authority.

Prepared and laid out to best specification and in accordance with RICS publication
'A PRICE OF LAND - BUILDING & UTILITY SERVICES AT SCALES 1:500 & LARGER, 3rd EDITION'

Utility Services Location Note:

This survey has been carried out using a combination of observation and detection using electromagnetic and ground probing radar equipment. Connections between reference points such as manholes are assumed to be straight unless bends are indicated. The accuracy is limited to the tolerances normally expected from the equipment used.

The following indications of completeness and accuracy are for guidance only.

In areas where there is a large concentration of services, the completeness will be between 80% and 90%. This will be reduced where there are obstructions at ground level.

Positional accuracy will vary with depth and pipe / duct material; an accuracy of +/- 150 mm is achievable in normal circumstances but this will be reduced for plastic pipes.

Existing information from historical plans is likely to be unreliable and is shown for guidance only.

Excavations in the area should be carried out with care and in accordance with HSG 47. No absolute guarantee of accuracy should be inferred from these plans.

The following text is an extract from Surveys of Land, Buildings and Utility Surveys at scales of 1:500 and Larger, 3rd Edition:

'Electronic tracing is a reliable method of locating buried services. On heavy, built up sites 85% completeness is probably all that can be expected. Plan accuracies of +/- 150mm may be achieved but the degree will depend on the type of the service (electricity cables should be more accurate than gas mains) and the material and diameter of the pipe. Where possible, depths should be measured but may be limited. Existing record information showing underground services is often inaccurate and of doubtful accuracy. It should be regarded only as an indication and cannot be guaranteed'
