1.0 **Introduction**

A new build residential development has been constructed on land off Kirkmanshulme Lane, Gorton. As part of the planning consent, validation tests of indoor sound levels are required. This report describes the results of these sound level validation tests.

2.0 **Planning Condition on Sound Levels**

Condition 22 of application reference 122160/FO/2018 calls for the development to be completed in accordance with the noise mitigation measures suggested in the submitted acoustic survey report.

22) a) The development hereby approved shall be completed in accordance with the revised Environmental Noise Study by Red Acoustics, referenced R1522-REP01-PB and dated 2 August 2019 stamped as received by the City Council, as Local Planning Authority, on the 13th August 2019, in relation to the acoustic treatment of the residential accommodation and external areas of the development hereby approved. The noise mitigation scheme hereby approved by the City Council as local planning authority, shall be completed before any of the dwelling units are occupied.

b) Prior to the first occupation of the development hereby approved, a verification report will be required to validate that the work undertaken throughout the development conforms to the recommendations and requirements in the approved scheme. The report shall also undertake post completion testing to confirm that the internal noise criteria has been met and non-conformities with the recommendations in the report shall be detailed along with any measures required to ensure compliance with the internal noise criteria. The approved scheme shall then be implemented prior to the first occupation of the accommodation.

Reason - In order to protect the future occupants of the residential accommodation from existing noise sources in the vicinity of the application site pursuant to policies SP1 and DM1 of the Core Strategy (2007) and saved policy DC26 of the Unitary Development Plan for the City of Manchester (1995).

Section b) of the above Condition calls for post completion sound validation tests to quantify the resulting internal sound levels. S & D Garritt Ltd have been employed to undertake the sound validation tests.

The report R1522-REP01-PB references on page 9 internal noise criteria as stipulated in BS 8233:2014 as being the internal noise targets agreed with the Local Environmental Health Department:

Table 3.2: BS8233:2014 Design Targets

Space	L _{Aeq,10hr} (07:00 - 23:00)	L _{Aeq,8hr} (23:00 - 07:00)	L _{Amax}
Living Room & Kitchen	35dB	-	-
Dining Room & Study	40dB	-	-
Bedroom	35dB	30dB	≤45dB
Garden & Patios	≤55dB	-	-

2.1 **BS 8233: 2014**

BS 8233 provides guidance on interior sound levels inside various building interiors caused by external sources of an anonymous nature, for example flowing road traffic. It is recommended that the internal ambient sound levels in dwellings do not exceed:

Living rooms	35 dB LA _{eq}	from 07.00-23.00
Dining rooms	40 dB LA _{eq}	from 07.00-23.00
Bedrooms	35 dB LA _{eq}	from 07.00-23.00
	30 dB LA _{eq}	from 23.00-07.00
Gardens	50 dB LA _{eq}	is the desirable limit
	55 dB LA _{eq}	is the upper guideline value.

The above sound limits are described in BS 8233 as applying to “steady external noise sources”. A note in paragraph 7.7.1 of the same document states that “Noise has a specific character if it contains features such as a distinguishable, discrete and continuous tone, is irregular enough to attract attention, or has strong low-frequency content, in which case lower noise limits might be appropriate.”

2.2 **World Health Organisation: 2000**

Guidance from the WHO gives additional guidance to BS 8233 on the interior sound levels in bedrooms at which sleep disturbance can be expected to occur:

Bedrooms	30 dB LA _{eq}	} to avoid sleep disturbance
	45 dB LA _{max}	

The guidance on LA_{max} is usually intended to apply to sound from regular and typical events only. The definition of ‘regular and typical’ is open to some interpretation and depends on the context and sources being considered.

3.0 **Test Methodology**

The methodology for the sound validation tests was discussed and agreed in advance with Rebecca Twigg in the Environmental Health Department at Manchester City Council.

Under ideal circumstances we would undertake validation tests over a period of a full weekday day and night to allow for a 16 hour and 8 hour respective measurement however as the site is an operational building site this was not possible. Instead it was agreed that short duration, attended measurements would be performed during the late afternoon to take measurements of daytime road traffic sound and that unattended monitoring equipment would then be installed in a bedroom to measure evening, night time and morning sound levels, to include a second period of peak traffic. It was agreed to take these measurements during an evening when the speedway was hosting a full event. This was considered to represent the reasonable worst case scenario.

Since this Speedway event fell on a Friday and Saturday evening we were able to leave equipment on site from Friday afternoon to Monday morning, site not operational during the weekend which allowed us the opportunity to collect a full set of measurement data on Saturday and Sunday. It is preferable to use weekdays for measurements since the sound levels differ at the weekend but the results collected on Saturday and Sunday are used in this report for information.

This report is to quantify the internal sound levels as required by the Planning Condition and does not provide an assessment of the impact of the speedway on the sound levels at the properties.

3.1 **Test Plots**

The scheme of validation tests in apartment Block 2 (the first apartment block to be completed) is given overleaf.

Plot No	Daytime validation tests	Night time validation tests
63	Kitchen / living room and bedroom overlooking Mount Road	Bedroom overlooking Mount Road
73	Kitchen / living room and bedroom overlooking Mount Road	Bedroom overlooking Mount Road
77	Kitchen / living room and bedroom facing towards speedway	Bedroom facing towards speedway
83	Kitchen / living room and bedroom facing towards speedway	Bedroom facing towards speedway

Plot 63 was chosen for use, with it being at ground floor level with the frontage standing slightly proud of the adjacent apartment and so representing the closest elevation to Mount Road. Plot 73 was chosen to represent a first floor plot on the corner of the building, so that the kitchen / living room has an additional side window. Since the rear elevation (facing towards the speedway) looks out onto the completed residential site the ground floor apartments will benefit from a barrier effect from noise of the speedway. Plots 77 and 83 were therefore chosen for use to represent apartments at first and second floor height, with 77 again standing slightly proud and 83 being a corner plot, and so again having an additional window in the kitchen / living room.

Daytime sound levels were taken using attended measurements in the kitchen / living rooms of the four plots, and unattended measurements in the bedrooms as marked on the floor plans on the previous page.

The plots are fitted with continuous flow PIV ventilation systems which were installed and operating in the test plots. Trickle vents were not fitted.

All sound levels were measured with four calibrated Type 1 sound level meters, full details of which are given in Appendix 1 of this report. Although the Condition stipulates levels spread over a 16 hour or 8 hour period, since weekday measurements could not be undertaken across this duration, measurements were instead taken at 15 minute intervals. This allows for observations to be made as to the specific noise levels during times of peak traffic and also before, during and after the speedway event.

This report provides numerical results for the periods obtained and the calculation of overall sound levels for the times available.

3.2 **Room Reverberation**

The rooms used were unfurnished except for kitchen units, which were fitted. Kitchen / living rooms had laminate floorings fitted, bedroom floors were bare concrete.

Reverberation tests were undertaken in all of the rooms used for validation testing so that corrections could be applied to take account of room furnishings and expected sound levels when occupied. The formula for applying reverberation time corrections in unfurnished dwellings is well recognised, being $10 \times \log (RT / 0.5)$ for the correction of a reverberant sound field. This is commonly used in pre-completion sound testing between dwellings for compliance with the Building Regulations.

The difficulty in applying this entire correction to these validation test results is that the sound source is an outdoor variable source with varying incident gradients on the building elevation and the internal sound field cannot be assumed to be entirely diffuse. This means that the above-mentioned method of applying corrections may be overly favourable, not sufficiently taking into account the direct, non-diffuse field from the building elevation. For these reasons, it has been concluded that a sensible engineered estimation for the correction needed to measured sound levels is to apply half the correction that the above formula yields. This has been undertaken in third octave frequency bands to maximise accuracy.

4.0 **Indoor Test Results**

Attended monitoring was performed in living rooms between 15.00 – 17.00 on Friday 12th July. The equipment was then monitoring in bedrooms from 17.30 on Friday 12th through to 09.30 on Monday 15th July, at which point site re-opened.

For the benefit of collecting extra data the site was closed throughout the weekend. Speedway events were being held on both the Friday and Saturday evenings. For information, and since we were unable to collect a 16 hour weekday measurement, the full weekend results are included in the following sections however it is noted that sound levels during the weekend are often lower than a typical weekday.

4.1 **Living Room Results**

After correcting for reverberation as discussed in section 3.0 the results of the attended measurements taken in the living rooms of the plots are given in the table below:

Start Time	Plot 63	Plot 73	Plot 77	Plot 83
	dB LA _{eq,15min}	dB LA _{eq,15min}	dB LA _{eq,15min}	dB LA _{eq,15min}
14:30	30.1	31.3		
14:45	30.1	31.8		
15:00	30.9	32.8	29.4	25.5
15:15	31.1	33.6	30.4	26.9
15:30	30.6	32.5	30.2	25.8
15:45	29.8	32.2	29.9	25.7
16:00	30.8	32.9	29.6	25.3
16:15	30.4	32.2	28.6	25
16:30	31.5	33.3	28.2	25.8
16:45	31.1	32.9	28.5	25.5
17:00	31.9	34.8	28.6	

The requirement of the Condition is not to exceed 35 dB LA_{eq,16hour}. This is achieved in all plots.

4.2 **Bedroom Results**

Daytime

The unattended survey contained 32 weekday daytime periods of fifteen minute measurements. When including the weekend results there is a total of 160 fifteen minute measurements. The overall time averaged sound level across the measured periods is shown in the table overleaf:

	Plot 63	Plot 73	Plot 77	Plot 83
Time	dB LA _{eq,T}	dB LA _{eq,T}	dB LA _{eq,T}	dB LA _{eq,T}
Speedway Friday 19:30 - 22:00	25.7	28.9	19.1	21.4
Speedway Saturday 19:30 - 22:00	26.3	28.7	22.3	24.3
Friday 17:30 - 23:00	28.2	28.5	19	21.2
Saturday 07:00 - 23:00	25.8	28.2	20.6	21.9
Sunday 07:00 - 23:00	24.7	27.4	21.9	20.9
Monday 07:00 - 09:30	28.8	32.3	18.6	20.8

The requirement of the Condition is not to exceed 35 dB LA_{eq,16hour}. This is achieved in all plots.

Night time

There were three sets of 32 fifteen minute night time measurements, representing full night times, between 23.00 and 07.00 on Friday, Saturday and Sunday night. As previously mentioned it is preferable to use weekday nights when possible but as we have collected the data the results for all three nights is provided. The overall time averaged sound levels across the full night time measurement periods were:

Time	Plot 63	Plot 73	Plot 77	Plot 83
	dB LA _{eq,8hour}	dB LA _{eq,8hour}	dB LA _{eq,8hour}	dB LA _{eq,8hour}
Friday Night	21.9	24.6	16.5	17.5
Saturday Night	21.9	24.5	16.2	17.9
Sunday Night	22	24.8	16.2	17.9

The requirement of the Condition is not to exceed 30 dB LA_{eq,8hour}. This is achieved in all plots.

Maximum sound levels

Maximum sound levels are also an important consideration in the assessment of night time noise. The requirement of the Condition is not to exceed 45 dB LA_{Max}, it is generally accepted that this is to apply to 'regular and typical' events. The highest night time maximum sound levels are shown in the table below:

Time	Plot 63	plot 73	plot 77	plot 83
	dB LA _{max,f}	dB LA _{max,f}	dB LA _{max,f}	dB LA _{max,f}
Friday Night	53.5	55.9	37.1	38.5
Saturday Night	55.8	54	37.4	37
Sunday Night	50.6	56.4	40.5	38.3

The requirement of the Condition is to not exceed 45 dB LA_{Max}. It can be seen this is achieved in plots 77 & 83 (which look towards the

inner of the site) however are exceeded in plots 63 and 73 which overlook Mount Road.

The unattended monitoring equipment is set to log sound levels every two minutes to allow for more thorough results analysis when needed. Upon analysis if the two minute logging data, which equates to 256 logged results per night in each plot, we are able to identify how many times the two minute periods exceed the required 45 dB LA_{Max} level.

The newly adopted Building Regulations Approved Document O (ADO) addresses the requirement for thermal comfort in residential buildings and considers noise, pollution and security in ensuring thermal comfort is achieved. The ADO stipulates using two minute sample periods as being appropriate for quantifying the number of individual events that occur during an entire night. The ADO considers the most relevant maximum result to be the 11th highest per night (i.e. excluding the highest 10 events per night).

The tables below show the maximum sound levels exceeded in 5 and 10 out of the 256 two minute logs (per night) in each plots 63 and 73p, and also the ranking of the log whereby the 45 dB LA_{Max} level is achieved.

Plot 63

Rank	Friday	Saturday	Sunday
6 (i.e excluding the highest 5 results)	45.3	45.3	45.5
11(i.e excluding the highest 10 results)	41.8	44.0	42.5
7 (compliance rank)	43.4	45.1	43.7

Plot 73

Rank	Friday	Saturday	Sunday
6 (i.e excluding the highest 5 results)	48.8	48.0	45.3
11(i.e excluding the highest 10 results)	45.3	44.9	44.2
11 (compliance rank)	45.3	44.9	44.2

It can be seen that the 45 dB LA_{Max} level is achieved by the 11th highest log in both plots on all nights, which would be complaint in accordance with the recommendations of the ADO.

APPENDIX 1 – EQUIPMENT AND QUALIFICATIONS

S & D Garritt Ltd are members of the Association of Noise Consultants (ANC). All work related to this report was undertaken by Elizabeth Garritt and David Garritt.

Elizabeth Garritt has been an associate member of the Institute of Acoustics since 2008 and holds an honours degree in Biomedical Science with a further post graduate diploma in Acoustics and Noise Control as issued by the Institute of Acoustics.

David Garritt has been a full member of the Institute of Acoustics since 2005 and holds an honours degree in Electronic and Computer Systems Engineering. David taught acoustics at post graduate level on a part time basis between 2010 - 2020. David sits on the ANC Communications and PR Committee.

The equipment used during the site visits is shown in the table below. The sound level meter was calibrated before and after use; no drift was apparent.

Equipment Description	Type number	Manufacturer	Date of expiration of Calibration	Calibration Certificate Number
Sound Level Meter	XL2 TA s/n a2a-08072-e0	NTi Audio	22.01.2026	2024-0190
