Executive Summary

Client	Conlon Construction Ltd
Location	Bignor Street Park, Cheetham Hill, Manchester, M8 0TZ
Description	The site covers an approximate area of 1.22 ha and is currently occupied by a public park comprising soft landscaped areas with a number of trees along the southern, eastern and western site boundaries, hard surfaced play areas to the north and a Brentfield Avenue forms the northern site boundary. Surrounding land uses are typical of a sub-urban area including extensive housing estates, schools and public open space.
Development	The proposal is for the redevelopment of the site with Olive Primary School including a new two storey school building in the north central area with associated play areas and playing fields along with an access road and car parking in the northern part of the site.
Site History	The site comprised rural agricultural land until the late 1800s when it was developed with rows of terraced houses with associated roads until the 1970s when it was cleared and became a public park. Surrounding land saw extensive residential development from the late 1890s with a small number of commercial and light industrial activities over the years including brick works, allotment gardens, fabric works and garages.
Geology	British Geological Survey mapping indicates the site to be underlain Glaciofluvial Sheet deposits comprising sand and gravel across the majority of the site with Devensian Till -Diamicton in the south western corner of the site. Solid bedrock comprises sandstone of the Chester Formation. Made Ground is also anticipated to be present across the site associated with the construction and demolition of historical buildings and infrastructure across the site. Available ground investigation information for the site identified variable Made Ground over interbedded cohesive and granular natural deposits. The depth to bedrock was not confirmed.
Radon	The radon guidance on protective measures for new dwellings indicates that the site is in a 'low' probability radon area where less than 1% of homes are estimated to be at or above the Action Level. Radon gas protection measures are therefore not required in the construction of new dwellings or extensions.
Mining & Ground Stability	The site is located within coal mining reporting area, however it is within a Development High Risk Area and there are no recorded shallow mine workings or mine entries within 1km of the sit. Therefore, no further assessment of the risk posed by historic coal mining considered to be required.
Flood Risk	According to the Flood Map for Planning the site is located within Flood Zone 1, whereby there is less than a 0.1% (1 in 1000) chance of flooding from rivers or the sea occurring each year. Given the site is in excess of 1 hectare and that the site may be located within a critical drainage area however and the Lead Local Flood Authority (LLFA) may still require a flood risk assessment to be carried out.
Environmental Setting	The Glaciofluvial Sheet and Devensian Till deposits indicated to be present beneath the site, are classified by the EA as a Secondary A Aquifer and an Undifferentiated Secondary Aquifer respectively. The underlying Chester Formation is classified as a Principal Aquifer. The site is not located within a groundwater SPZ and there are no groundwater abstraction points recorded within 500m from the site.
UXO	The site is an area of medium UXO risk and therefore mitigation measures are required during any intrusive works.

© Clancy Consulting 2022

Further Works / Considerations

The following should be considered for the proposed development:

- Carry out a flood risk assessment.
- Carry out an intrusive site investigation to confirm ground conditions, including the depth and nature of the Made Ground soils and underlying natural strata.
- All intrusive works to be supervised by an EOD engineer.
- Installation of ground gas and groundwater monitoring wells in boreholes and post fieldwork monitoring program comprising a minimum 6 visits over a minimum three month period.
- In-situ testing and geotechnical soil sampling should be carried out during intrusive investigation to provide adequate recommendations for foundation design.
- Trial pitting to provide a good visual assessment of the shallow soils and to allow initial observations of relic structures present beneath the site.
- Soil samples should be recovered from across the site to be tested for potential contaminants. This should include as a minimum pH, metals, asbestos screening, speciated PAH and speciated TPH.
- Soakaway testing will be required to assess soil infiltration rates and assist with preparation of a detailed drainage strategy.

1.0 Introduction

1.1 Background

Clancy Consulting Limited has been instructed by Conlon Construction Limited to carry out a Phase 1 Desk Study for the Bignor Street Park site in Cheetham Hill, Manchester, M8 0TZ. The site currently comprises a public park including grassland with a number of mature and semi-mature trees and a hard surfaced play area to the north of the site.

The site is proposed to be developed with Olive Primary School comprising a new two storey school building with associated play areas, playing fields, access and car parking.

A site location plan and proposed development plan are presented in Appendix I.

1.2 Objectives

The objectives of this investigation are summarised below:

- Provide a review of the site's land use history by reference to ordnance survey maps of the area.
- Assess the environmental setting, geology, hydrology, hydrogeology, mining and subsidence history of the site and surrounding area.
- Consider the potential risk to end users of the site from unexploded ordnance (UXO).
- Consider the potential risk to end users of the site from hazardous ground gas.
- Consider potential geotechnical constraints for the proposed development.
- Develop a preliminary risk assessment and a detailed 'conceptual site model' with regard to potential contamination sources, pathways and receptors.
- Provide recommendations regarding the requirement for further investigations, if required, to satisfy the Local Planning Authority.

1.3 Limitations of the Study

Clancy Consulting Limited cannot be held responsible for any omissions, misrepresentation, errors or inaccuracies with the supplied third-party report information. The report is written in the context of an agreed scope of work and budget and should not be used in a different context. New information or improved practices and changes in legislation may require a reinterpretation of the report in whole or in part.

Clancy Consulting Limited reserves the right to amend either conclusions or recommendations in light of any further information that may become available. The report is provided for the sole use of Conlon Construction Ltd for the objectives discussed previously only and is confidential to them.

The report may not be relied upon by any other party without prior written consent of Clancy Consulting Limited. Those using this information in subsequent assessments or evaluations do so at their own risk.

2.0 Desk Study

2.1 General

Background information was sought from the following sources:

- Site walkover (photographic records in Appendix II).
- Ordnance Survey historical maps (selected copies included in Appendix III).
- Zetica Bomb Risk Mapping (Appendix IV).
- British Geological Survey (BGS) sheets (Appendix V).
- Coal Authority Consultants Report (Appendix VI)
- Environment Agency site sensitivity & flood risk maps (Appendix VII).
- Environmental datasheets (Appendix VIII).

2.2 Site Setting and Description

The site is located approximately 2km north of Manchester city centre in the area of Cheetham Hill at OS Grid Reference 384150, 400780. The site covers an approximate area of 1.22ha, forming a roughly rectangle shaped parcel of land currently occupied by Bignor Street public park comprising soft landscaped area with a number of semi-mature and mature trees along the eastern, southern and western site boundaries and an all weather play area to the north. Brentfield Avenue forms the northern site boundary with Heywood Street to the east and Tamerton Drive to the south and west.

The site is generally level with a small change in elevation from 64m AOD in the north east to 61m AOD in the south and south west. A topographical survey drawing showing the existing site layout and levels is present in Appendix I.

The site is located within a predominantly residential sub-urban area with a housing estate immediately to the east, a dog park to the north, a day nursery to the west and New Testament Church of God to the south.

During the site walkover a number of access points to the park were noted, with a gated access located in the north east, off Brentfield Avenue.

2.3 Site History

In order to investigate the development history and previous land uses at the site and surrounding area, historical OS maps were examined. Copies of the maps are presented in Appendix III.

Table 1 below is not intended to provide a comprehensive review of all the changes which have occurred at the site and instead provides a summary of the most salient points relating to the development history of the site. The most significant historical land uses are highlighted in bold text for ease of reference.

Table 1 – Site History

Date(s)	Site	Surrounding Land
1848 - 1850	The site formed part of a **rural fields.**	**Rural fields** border the site with a number of **ponds** recorded 25m southeast, 85m and 140m north west, 160m south and 275m west. From 100m to the east an area including **The Temple, Temple House** and **St Luke's Church** with landscaped grounds **and pond / lake** is present with **Cheetham Hill Road** at 255m, **graveyard** and a **bowling green** at 290m.
1890 - 1894	No development on site with **Bignor Street** forming the northern site boundary.	**Heywood Street** forms the eastern site boundary and **residential developments** are present from 35m to the west and 40m south

© Clancy Consulting 2022

Date(s)	Site	Surrounding Land
		of the site. A **reform club** with **bowling green** is 20m north east of the site. The ponds are no longer present. **Brick works** are shown 400m south west.
1908 - 1910	The site is now part of **residential development** with rows of terraced properties and roads covering the site. **Maud Street** and **Penrose Street** crossing the site from east to west in the central portion of the site.	Further **residential development** is underway across the surrounding areas with **parks, sports ground, church, bowling green** and **schools** recorded within 500m of the site. A **sand pit** is shown 365m to the north. **Clay pits** associated with brick works are shown from 310m south west and 400m south east. The bowling green and reform club to the east are redeveloped to a '**convent'**.
1922 – 1933	No change.	The sand pit to the north has been **infilled** and developed with **residential properties**. Further **residential development** is noted from 55m to the south east and **allotment gardens** are shown 160m to the north.
1948 – 1953	No change.	**Textile Works** is now present 40m south east, **a clothing factory** is shown 40m west, **raincoat factory** 106m south west, **garages** 160m west and a **warehouse** 230m north west. **Marble works** is shown 170m north east. **Manchester Northern Hospital** is now developed from 288m to the north east.
1972 – 1987	The site has been cleared and indicated as **recreational ground.**	The clay pits to the south west are now developed with **recreational grounds, a factory and unspecified buildings**. The 'convent' and associated infrastructure are now **cleared** along with a number of residential properties in the surrounding area. The residential areas to the south and west have been reconfigured. A **nursery** is present 25m to the west and **Tamerton Drive** forms the southern and western site boundary.
1992	No change.	The vacant land of the former 'convent' opposite Heywood Street is now developed with **residential properties**.
2000 – 2022	No change.	No significant changes.

2.4 UXO Risk Assessment

A review of publicly available bomb risk mapping from Zetica indicates the site to be in an area of medium UXO risk. In addition, we have been provided with a Detailed UXO Threat and Risk Assessment by 6 Alpha Associates in November 2020 which confirmed that the site is in a Medium UXO risk area and further action will be required during intrusive activities to reduce risk to site operatives.

Zetica bomb risk mapping for the site is included in Appendix IV.

2.5 Geology

According to the British Geological Survey (BGS) 1:50,000 map of the area (Sheet 085, Manchester) the site is underlain by superficial Glaciofluvial Sheet Deposits comprising sand and gravel with Diamicton – Devensian Till recorded beneath the south west portion of the site. The underlying bedrock geology is indicated to comprise sandstone of the Chester Formation.

© Clancy Consulting 2022

Made Ground is anticipated to be encountered across the site associated with the historical development of terraced houses, roads and the infill of any potential historic basements. A ground investigation previously carried out at the site by Dunelm in 2020 and made available to us confirm the presence of variable Made Ground across the site at depths ranging from 0.60m to 3.55m bgl overlying interbedded cohesive and granular deposits to a maximum proven depth of 20m bgl.

Copies of the geological plans are provided in Appendix V.

2.6 Mining and Ground Stability

The site is indicated to lie within a Coal Mining Reporting Area and on that basis a Consultants Coal Mining Report has been obtained for the site and presented in Appendix IV. The report confirmed that the site does not lie within a Development High Risk Area, there are no recorded shallow mine workings or mine entries within 1km of the site and therefore, no further assessment of the risk posed by historic coal mining considered to be required.

The environmental database report indicates that the site represents a very low risk with regard to ground stability issues relating to ground dissolution, collapsible ground, compressible ground, landslides, shrinking/swelling clay and running sand.

Four BGS recorded mineral sites are indicated to be present within 500m of the site with the nearest one located 411m to the north associated with historical opencast extraction of sand from Alms Hill Sand Pit. These are not considered to represent a significant risk to the proposed development.

2.7 Hydrogeology

The Glaciofluvial Sheet deposits underlying the majority of the site are classified by the EA as a Secondary A Aquifer, which are permeable deposits that can support local water supplies rather than at a regional scale. The Devensian Till deposits in the southwestern corner of the site are classified as Secondary Undifferentiated Aquifer. These soils have varying permeability characteristics in different areas.

The Chester Formation, indicated to be present beneath the superficial deposits, is classified by the EA as a Principal Aquifer. These are rock layers with a high intergranular and/or fracture permeability therefore they may support water storage on a larger, strategic scale. There is a small area in the north eastern corner or the site which is designated to be Secondary B Aquifer.

According to EA data, the site is not located within a groundwater Source Protection Zone (SPZ).

Information provided by the EA indicates that there are no records of licensed groundwater abstractions within 500m of the site. The closest is located 935m south of site associated with farming and domestic use.

Groundwater quality beneath the site has been classified as ‘Poor’ under an EA Local River Basin Management Plan.

2.8 Hydrology

The closest water feature to the site is The River Irk, located approximately 1km to the east of the site.

There are no records of licensed surface water abstractions indicated to be present within 1km of the site.

There are no records of discharge consents recorded within 500m of the site.

Two pollution incidents to controlled waters are recorded within 500m of the site, located 296m and 372m south east of the site both considered as Category 3 – Minor Incidents dated August 1995 and June 1996. None of these incidents are likely to pose a significant risk to the proposed development.

© Clancy Consulting 2022

2.9 Soil Geochemistry

According to the BGS National Geoscience Information Service, the following background soil concentrations can be expected within natural soils at the site:

- Arsenic – 15-35 mg/kg
- Cadmium - <1.8 mg/kg
- Chromium – 60-90mg/kg
- Lead – 100-200 mg/kg
- Nickel – 15-45 mg/kg

These concentrations are not considered to be elevated.

It should be noted that the soil geochemistry has been estimated solely on the basis of published geology and not empirical data.

2.10 Flood Risk

According to the Flood Map for Planning site is located within Flood Zone 1, whereby there is less than a 0.1% (1 in 1000) chance of flooding from rivers or the sea occurring each year.

The environmental database report indicates that there is limited potential for groundwater flooding to occur at the ground surface.

As the site is more than 1 hectare and it may be located within a critical drainage area, a flood risk assessment will likely be required to be carried out for the site.

Copies of the site sensitivity and flood risk maps are included in Appendix VII.

2.11 Radon Risk Potential

The radon guidance on protective measures for new dwellings indicates that the site is in a ‘low’ probability radon area where less than 1% of homes are estimated to be at or above the Action Level.

Radon gas protection measures are therefore not necessary in the construction of new dwellings or extensions.

2.12 Landfill Sites

There are no active or recent landfill records within 500m of the site.

There are three historical landfill sites recorded within 500m of the site located between 350m south west and 434m south east of the site, and one registered waste treatment site at 323m to the south west (licence lapsed/cancelled).

Six areas of potentially infilled land (non-water) have been identified within 500m of the site with the nearest one located 300m to the south west associated with the infill of a pit. From historical maps that corresponds to the clay pits associated with the brick works to the south west of the site.

Nine areas of potentially infilled land (water) have been identified within 500m of the site with the nearest one located 100m north west, associated with an infilled historical pond.

Areas of infilled land water were also identified on a review of historical maps of the area. These include a field pond 20m to the south east and a pond / lake 110m to the east.

These are not considered to represent a significant risk to the proposed development due to their distance from the site, date of infill and the subsequent development over the majority of them.

© Clancy Consulting 2022

2.13 Industrial Land Uses

There is one active Local Authority Pollution Prevention and control entry located 332m north and associated with a petrol filling station from 1998.

There are six active Contemporary Trade Directory entries recorded within 500m of the site. These relate to boiler service and repairs, MOT testing centre, tyre dealer, garage services and an electrical goods manufacturer. The closest entry refers to the boiler services located 131m to the north.

There are two fuel station entries within 500m of the site; 225m north east which is obsolete, and 333m north associated with an active petrol station.

Full details of the waste management and industrial land uses are detailed in the environmental database presented in Appendix VIII.

2.14 Sensitive Land Uses

The site is located within a Nitrate Vulnerable Zone.

2.15 Potential Geotechnical Constraints

The table below summarises the potential geotechnical hazards identified during this study. The table provides an assessment of whether the site is likely to be affected by the hazard and the possible consequences and engineering considerations. It should however be noted that this assessment should be considered preliminary and should be confirmed through intrusive investigations.

Table 2 – Potential Geotechnical Constraints

Hazard Description	Is hazard likely to be present / affect the site? (H / M / L?)	Comments
Made Ground	M	Made ground is anticipated to be present beneath the site associated with historic development, and it may be deeper in places associated with historical basements. Made Ground beneath the site would not form a suitable bearing stratum for traditional foundations. The underlying Glaciofluvial Sheet Deposits would likely support strip or pad foundations. If the thickness of Made Ground is significant in the proposed development area, over deepening of foundations or a piled foundation solution may be required.
Obstructions (including foundations, basements, tunnels and adjacent sub-structures)	L/M	The site has not had a complex development history, however there is still a possibility for buried structures to be present associated with the historical roadways and residential properties.
Ground dissolution features/natural cavities	L	Ground conditions beneath the site are not anticipated to be consistent with these features.
Compressible or low bearing capacity soils.	L/M	Shallow natural soils may be low strength and compressible. However, these are likely to become more competent with depth.
Shrinking and swelling clays	L/M	Clay soils are expected at shallow depth and may be susceptible to volume change hazards. The presence of trees and tree removal may necessitate any shallow foundations to be over deepened and heave protection provided. Foundations should be constructed in accordance with Appendix 4.2 of the NHBC guidance (Building Near Trees) when designing foundations.
Slope stability/Retaining wall issues	L	The proposed development is not anticipated to include earthworks to bring up / reduce site levels other than for the formation of the proposed basement. Therefore, slope stability is not considered an issue at this stage.

© Clancy Consulting 2022

Hazard Description	Is hazard likely to be present / affect the site? (H / M / L?)	Comments
High groundwater table (including waterlogged ground)	L/M	Perched groundwater may be present in granular layers of the Made Ground and underlying Glaciofluvial Sheet deposits. Groundwater levels should be monitored as part of any intrusive site investigation.
Underground mining and mine entries	L	The site is not located in a high risk development area.
Aggressive ground conditions / concrete classification	M	Made Ground is anticipated to be present beneath the site. Such material can have a low pH and contain high concentrations of sulphates, giving rise to acid ground conditions. Suitable testing will be required during any site investigation works.
Seismic Activity	L	The Eurocode 8 seismic hazard zoning maps for the UK (Musson and Sargeant, 2007) indicate that horizontal Peak Ground Acceleration (PGA) values with 10% probability of being exceeded in 50 years (475 year return period) are between 0.00g and 0.02g, which is considered very low.
NOTES: H – High Risk; M – Medium Risk; L – Low risk		

© Clancy Consulting 2022

3.0 Phase 1 Risk Assessment

3.1 General

The “suitable for use” approach is adopted for the assessment of contaminated land and remedial measures are only undertaken where unacceptable risk to human health or the environment can be proven when taking into account the proposed use of the site and environmental setting.

A risk assessment process should be carried out to determine potential hazards to human health and the environment and be based on the “source” “pathway” “receptor” principal. For a potential risk to be present there must be a viable pollutant linkage whereby a contamination source may impact upon a receptor. The absence of one or more of these key components (source, pathway or receptor) prohibits a viable pollution linkage being formed.

3.2 Preliminary Conceptual Site Model

In accordance with the ‘Land Contamination Risk Management’ (LCRM) guidance on the gov.uk website (updated April 2021) and BSI 10175 “Code of Practice for Investigation of Potentially Contaminated Land” (2011), a Preliminary Conceptual Site Model was developed to identify potential contamination sources, migration pathways and receptors within the study area.

3.3 Potential Contaminant Sources

The site has not had a significant development history having been developed with terraced houses and roadways before being cleared and used as a public park. Made Ground is anticipated to be present across the majority of the site and may be locally deeper around areas where basements might have been present. Any such Made Ground should be considered a potential source of contamination. Contaminants of concern include metals / metaloids, PAHs, TPHs and asbestos. Historic land use and the presence of Made Ground may also have resulted in acidic ground conditions.

Historical surrounding land use was predominantly residential in nature, inclusive of residential property, schools and places of worship with some commercial and light industrial uses too. Areas of potentially infilled land were indicated to be present in the vicinity of the site, including historical ponds, sand pit and clay pits, however these were at sufficient distance from the site not to be considered a significant risk to the proposed development.

Current surrounding land use is predominantly residential in nature with no obvious off-site contamination sources identified.

In regards to hazardous ground gasses, the infilled land within the surrounding area is considered to have a ‘very low’ to ‘low’ gas generation potential owing to the size and date the features were infilled (in accordance with Figure 6 of BS 8576:2013 “Guidance on investigations for ground gas – Permanent gas and Volatile Organic Compounds (VOCs)”). The main potential source of concern is considered to be potentially extensive Made Ground deposits on site. Though the Made Ground is likely to have a ‘low’ gas generation potential due to its likely composition comprising demolition materials, significant thicknesses / extensive deposits may result in the accumulation of significant volumes of ground gases.

The following potential sources of contamination have been identified at the site:

- Made Ground and contamination associated with historic construction and demolition of residential buildings at the site.
- Made Ground and contamination associated with construction and demolition of the surrounding area over the years.
- Potential generation of hazardous ground gases associated with deep Made Ground (if present) and putrescible materials present at the site and in winder surrounding area.

© Clancy Consulting 2022

3.4 Potential Pathways

The proposal is set to include the development of the site with a new school building with associated access, car parking and soft and hardscaped areas. The following potential pathways are considered applicable at the site:

- Direct contact (soft landscaping at the site)
- Inhalation (dust / vapors)
- Ingestion
- Vertical / lateral migration (of both contamination and potentially hazardous ground gases)

3.5 Potential Receptors

Potential human health receptors include future site users and neighboring residential property occupiers.

Proposed new buildings at the site and new water pipes are also be considered as receptors.

The underlying Secondary and Principal Aquifers are considered the main environmental receptors of concern.

The nearest surface water feature, the River Irk is also considered to be a potential receptor.

3.6 Preliminary Risk Assessment

A preliminary risk assessment can be carried out using guidance outlined in Section 6.3 of CIRIA Document C552 “Contaminated Land Risk Assessment – A Guide to Good Practice” (2001). For a risk to be present there must be a viable pollutant linkage whereby a contamination source can impact on a receptor via a pathway. To carry out the risk assessment an estimate must be made of the potential severity of the risk and the likelihood of the risk occurring. The following Tables set out the criteria for this principal.

Table 3 - Severity of Risk

Severity	Description
Severe	Acute risk to human health likely to result in ‘significant harm’ i.e. very high concentrations of contamination or ground gases. Catastrophic damage to building i.e. by explosion from high gassing sites or VOC concentrations. Major pollution of controlled waters i.e. surface watercourses and Principal aquifers, source protection zones. Short term damage to ecosystems.
Medium	Long term risk to human health likely to result in ‘significant harm’ i.e. elevated concentrations of contaminants or ground gases. Pollution of sensitive controlled watercourses i.e. Principal or Secondary Aquifers. Significant effects on sensitive ecosystems or species.
Mild	Pollution of non-sensitive waters i.e. smaller surface watercourses or unproductive strata. Significant damage to crops, buildings, structures or services i.e. by explosion from sites with medium gassing potential, elevated concentrations of contaminants.
Minor	Non-permanent human health effects i.e. requirement for protective equipment during site works to mitigate health effects. Damage to non-sensitive ecosystems or species. Minor damage to buildings, structures or services.

© Clancy Consulting 2022

Table 4 - Probability of Risk Occurring

Probability	Description
High Likelihood	Pollutant linkage may be present that appears very likely in the short term and risk is almost certain to occur in long term or evidence of harm to receptor exists.
Likely	Pollutant linkage may be present and is likely that the risk will occur over the long term.
Low Likelihood	Pollutant linkage may be present and there is a possibility of the risk occurring although no certainty that it will do so.
Unlikely	Pollutant linkage may be present but the circumstances under which harm would occur even in the long term are improbable.

Table 5 - Comparison of Risk & Probability

Probability	Severity			
	Severe	Medium	Mild	Minor
High Likelihood	Very High	High	Moderate	Moderate/Low
Likely	High	Moderate	Moderate/Low	Low
Low Likelihood	Moderate	Moderate/Low	Low	Very Low
Unlikely	Moderate/Low	Low	Very Low	Very Low

A summary of potential pollutant linkages and perceived risks for this site are outlined in the Table below:

© Clancy Consulting 2022

Table 6 - Pollutant Linkages & Perceived Risk

Sources of Contamination	Pathways	Receptors	Severity	Probability	Risk	Justification	Further Action Required
On site: Made Ground from the construction and demolition of historical terraced houses and roadways.	Inhalation, ingestion and dermal contact of soil	Future site users	**Medium** Long term risk to human health	**Low Likelihood**	**Moderate/Low**	Contaminants of concern may be present beneath the site, associated with the Made Ground from the onsite construction/demolition history. It is however considered of low likelihood that contaminants of concern would be present in significant concentrations.	Site investigation to confirm the contamination status of shallow soils beneath the site.
		Construction workers during development	**Minor** Non-permanent human health effects i.e. requirement for protective equipment during site works to mitigate health effects	**Low Likelihood**	**Very Low**	If construction workers come into contact with potential contaminated soils during the construction phase, such contact would be short term, limiting potential exposure. Construction workers are expected to undertake good working practices including regular hand washing and other hygiene techniques which would reduce the likelihood of long-term exposure to any contamination.	
	Acidic ground conditions affecting future site buildings	Building infrastructure	**Minor** Minor damage to buildings	**Low Likelihood**	**Very Low**	Made Ground and natural soils beneath the site may contain elevated concentrations of sulphates and low pH. Chemical testing for water soluble sulphate and pH should be undertaken to inform concrete classification. Should organic contamination be present thought should be given to barrier pipe / protective measures for proposed incoming water pipes.	
	Vertical and lateral migration	Neighbouring properties	**Medium** Long term risk to human health	**Unlikely**	**Low**	Neighbouring land use is predominantly residential properties in nature. It is considered unlikely that contamination would be present in sufficient concentrations beneath the site to adversely affect neighbouring site users.	
		Controlled waters	**Medium** Pollution of sensitive controlled water receptors	**Low Likelihood**	**Moderate/Low**	The majority of the site is underlain by a Secondary A Aquifer relating to the superficial Glaciofluvial Sheet deposits and a Principal Aquifer relating to the bedrock Chester Formation. However, the site is not located within a groundwater SPZ and the nearest groundwater abstraction is indicated to be in excess of 500m from the site. Therefore, these aquifers are not considered to represent sensitive groundwater resource receptors. It should be noted that If a pilling foundation solution into the underlying bedrock is utilised for the proposed development a contamination pathway will be created. Depending on the findings of the site investigation an environmental piling risk assessment might be necessary.	
Off site: Construction of nearby properties highways infrastructure.	Lateral migration onto site with subsequent dermal contact of soils	Future site users	**Medium** Long term risk to human health	**Unlikely**	**Low**	Current surrounding land use is predominantly residential in nature. Potential sources of contamination associated with these land uses are likely restricted to runoff from the adjacent roads.	
Potential hazardous ground gas and vapours from Made Ground on and off site including infilled sand pit and clay pits in the wider surrounding area.	Migration of ground gas	Future site users	**Severe** Acute risk to human health (asphyxiation)	**Low Likelihood**	**Moderate**	Made Ground beneath the site may represent potentially significant sources of ground gas if present in significant quantities Though the gas generation potential is likely to be 'low'. Infilled land associated with historical infilled land in the surrounding area may also represent a potential source of hazardous ground gas. However, given the distances and dates of infill this is considered unlikely.	Monitoring wells should be installed as part of the investigation to assess the risk from hazardous ground gas to the proposed development and future site users.
		Building Infrastructure	**Medium** Elevated concentrations of ground gas	**Low Likelihood**	**Moderate/Low**

4.0 Conclusions and Recommendations

Clancy Consulting Limited has been instructed by Conlon Construction Limited to carry out a Phase 1 Desk Study for the Bignor Street Park site in Cheetham Hill, Manchester, M8 0TZ. The site which currently comprises a public park with grassland and hardstanding play areas to the north, is proposed to be developed with a new school with associated access, car parking, soft and hardscaped areas.

The site comprised rural agricultural land until early 1900s when the site was developed with rows of terraced houses and associated roads until circa 1978 when it was cleared and has been used as a public park since. Surrounding land saw extensive residential development from the late 1890s with a small number of commercial and light industrial activities over the years including brick works, allotment gardens, fabric works and garages.

The site is indicated to be at medium risk from UXO. Therefore, further action will be required during intrusive activities to reduce risk to site operatives.

British Geological Survey mapping indicates the site to be underlain Glaciofluvial Sheet deposits comprising sand and gravel across the majority of the site with Devensian Till - Diamicton in the south western corner of the site. Solid bedrock comprises sandstone of the Chester Formation. Made Ground is also anticipated to be present across the site associated with the construction and demolition of historical buildings and infrastructure across the site. Available ground investigation information for the site identified variable Made Ground over interbedded cohesive and granular natural deposits. The depth to bedrock was not confirmed.

Cohesive soils are anticipated to be present at shallow depths beneath the site which may have potential to shrink or swell particularly given the presence of mature trees on site. Any site investigations should include an assessment of the volume change potential where new foundations are to be formed.

The Glaciofluvial Sheet and Devensian Till deposits indicated to be present beneath the site, are classified by the EA as a Secondary A Aquifer and an Undifferentiated Secondary Aquifer respectively. The underlying Chester Formation is classified as a Principal Aquifer. The site is not located within a groundwater SPZ and there are no groundwater abstraction points recorded within 500m from the site.

Given the site is in excess of 1 hectare and that the site may be located within a critical drainage area, theLead Local Flood Authority (LLFA) may still require a flood risk assessment to be carried out.

Given the development history of the site and surrounding area, the potential for significant concentrations of contaminants of concern to be present beneath the site is considered to be low however may be present locally. Should significant thicknesses or extensive deposits of Made Ground be present, this may result in the accumulation of significant volumes of hazardous ground gases.

On the basis of the above, the following further works are recommended:

- Carry out a flood risk assessment.
- Carry out an intrusive site investigation to confirm ground conditions, including the depth and nature of the Made Ground soils and underlying natural strata.
- All intrusive works to be supervised by an EOD Engineer.
- Installation of ground gas and groundwater monitoring wells in boreholes and post fieldwork monitoring program comprising a minimum 6 visits over a minimum three month period.
- In-situ testing and geotechnical soil sampling should be carried out during intrusive investigation to provide adequate recommendations for foundation design.
- Trial pitting to provide a good visual assessment of the shallow soils and to allow initial observations of relic structures present beneath the site.
- Soil samples should be recovered from across the site to be tested for potential contaminants. This should include as a minimum pH, metals, asbestos screening, speciated PAH and speciated TPH.

© Clancy Consulting 2022

- Soakaway testing will be required to assess soil infiltration rates and assist with preparation of a detailed drainage strategy.

DISCLAIMER

Whilst every effort has been taken in the preparation of this drawing, the original land marks/apparatus configuration may have been altered since the survey/drawing was produced. The user shall make further enquiries and investigations to satisfy himself as to the accuracy of this drawing and position of the apparatus. The exact positions of the apparatus should be verified by the use of suitable detection devices and safe digging practices in accordance with HSG47, further advice on the location of apparatus should be recommended by the owner. No representation is made by Greenhatch Group, its agents or servants as to the accuracy, completeness, and sufficiency or otherwise of this drawing and the position of the apparatus.

All apparatus shall be treated as live unless proved otherwise by the owner. It is the users responsibility to ensure that the information on the location of apparatus is provided to all persons (either direct labour or contractors) working in proximity to the apparatus.

Lancashire And Furness

Published 1909 - 1910

Source map scale - 1:10,560

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840`s. In 1854 the 1:2,500 scale was adopted for mapping urban areas; these maps were used to update the 1:10,560 maps. The published date given therefore is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas. In the late 1940`s, a Provisional Edition was produced, which updated the 1:10,560 mapping from a number of sources. The maps appear unfinished - with all military camps and other strategic sites removed. These maps were initially overprinted with the National Grid. In 1970, the first 1:10,000 maps were produced using the Transverse Mercator Projection. The revision process continued until recently, with new editions appearing every 10 years or so for urban areas.

LANDMARK INFORMATION GROUP®

Manchester

Published 1975

Source map scale - 1:25,000

These maps were produced by the Russian military during the Cold War between 1950 and 1997, and cover 103 towns and cities throughout the U.K. The maps are produced at 1:25,000, 1:10,000 and 1:5,000 scale, and show detailed land use, with colour-coded areas for development, green areas, and non-developed areas. Buildings are coloured black and important building uses (such as hospitals, post offices, factories etc.) are numbered, with a numbered key describing their use.
They were produced by the Russians for the benefit of navigation, as well as strategic military sites and transport hubs, for use if they were to have invaded the U.K. The detailed information provided indicates that the areas were surveyed using land-based personnel, on the ground, in the cities that are mapped.

10k Raster Mapping

Published 1999

Source map scale - 1:10,000

The historical maps shown were produced from the Ordnance Survey`s 1:10,000 colour raster mapping. These maps are derived from Landplan which replaced the old 1:10,000 maps originally published in 1970. The data is highly detailed showing buildings, fences and field boundaries as well as all roads, tracks and paths. Road names are also included together with the relevant road number and classification. Boundary information depiction includes county, unitary authority, district, civil parish and constituency.

VectorMap Local

Published 2022

Source map scale - 1:10,000

VectorMap Local (Raster) is Ordnance Survey's highest detailed 'backdrop' mapping product. These maps are produced from OS's VectorMap Local, a simple vector dataset at a nominal scale of 1:10,000, covering the whole of Great Britain, that has been designed for creating graphical mapping. OS VectorMap Local is derived from large-scale information surveyed at 1:1250 scale (covering major towns and cities),1:2500 scale (smaller towns, villages and developed rural areas), and 1:10 000 scale (mountain, moorland and river estuary areas).

LANDMARK INFORMATION GROUP®

Lancashire And Furness

Published 1850

Source map scale - 1:1,056

The 1:1056 scale of Ordnance Survey mapping was adopted from Ireland in 1848 and was used to survey towns with a population of over 4000, plus county towns of lesser population, in those counties mapped at the six-inch scale in 1841-55. The scale was the largest scale at which London was mapped by the Ordnance Survey and a 'skeleton' survey of the capital, showing little more than streets, street names, frontages and altitudes, was undertaken between 1848 and 1850. The majority of the 1:1056 surveys were later replaced by 1:500 surveys; although almost all the remainder were revised at this scale, sometimes more than once before 1895. The type of detail shown on the 1:1056 scale is broadly similar to that on 1:500; the apparent omission of minor details such as sewer access points and street lights may be as much a reflection of the generally earlier date of these plans, as of the specification of the map.

Please note: Due to the partial coverage of Historical Town Plans, it is possible that not all segments within an order will contain mapping. Only the segments that have Town Plan coverage will be generated.

LANDMARK INFORMATION GROUP®

Lancashire And Furness

Published 1893

Source map scale - 1:2,500

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840`s. In 1854 the 1:2,500 scale was adopted for mapping urban areas and by 1896 it covered the whole of what were considered to be the cultivated parts of Great Britain. The published date given below is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas.

Large-Scale National Grid Data

Published 1992

Source map scale - 1:1,250

'Large Scale National Grid Data' superseded SIM cards (Ordnance Survey's 'Survey of Information on Microfilm') in 1992, and continued to be produced until 1999. These maps were the fore-runners of digital mapping and so provide detailed information on houses and roads, but tend to show less topographic features such as vegetation. These maps were produced at both 1:2,500 and 1:1,250 scales.

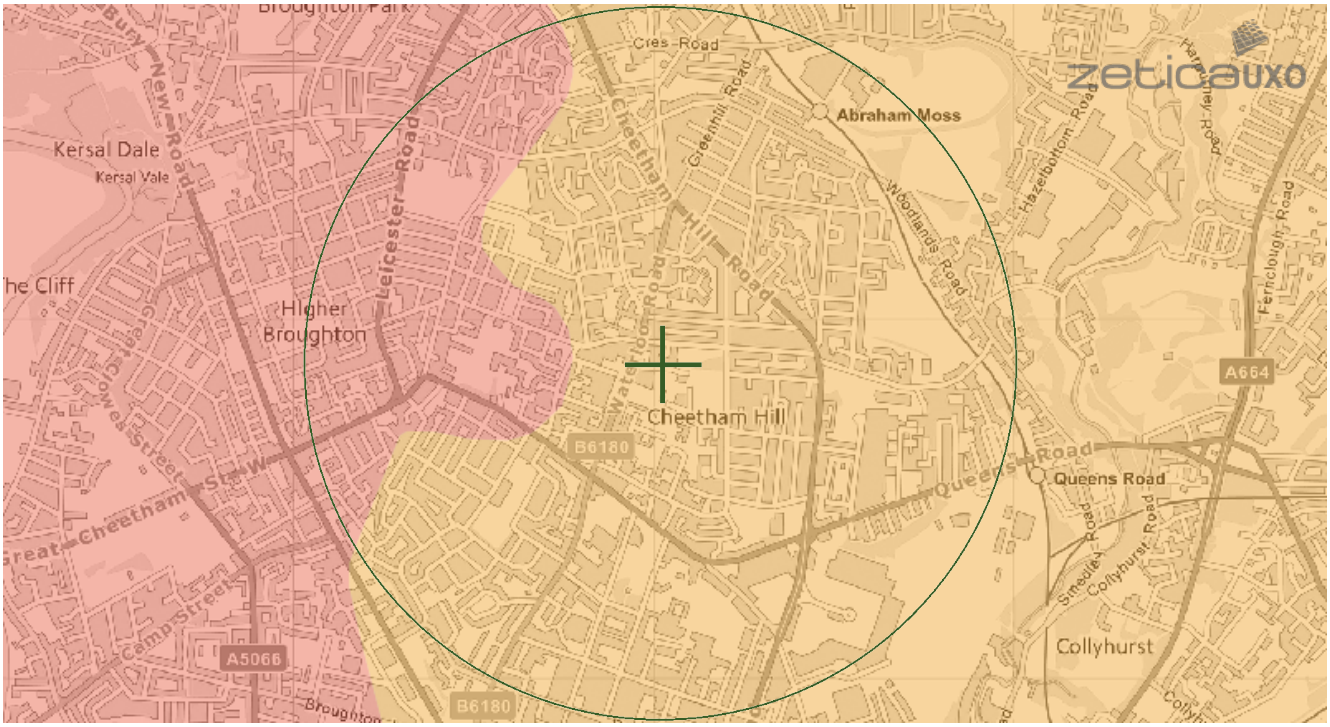
ZETICA BOMB RISK MAPPING

UNEXPLODED BOMB RISK MAP

SITE LOCATION

Location: M8 0TZ,
Map Centre: 384032,400877



LEGEND

High: Areas indicated as having a bombing density of 50 bombs per 1000acre or higher.

Moderate: Areas indicated as having a bombing density of 15 to 49 bombs per 1000acre.

Low: Areas indicated as having 15 bombs per 1000acre or less.

miltary | **industry** | **UXO find**

transport | **dock** | **Luftwaffe targets**

utilities | **Bombing decoy** | **other**

How to use your Unexploded Bomb (UXB) risk map?

The map indicates the potential for Unexploded Bombs (UXB) to be present as a result of World War Two (WWII) bombing.

You can incorporate the map into your preliminary risk assessment* for potential Unexploded Ordnance (UXO) for a site. Using this map, you can make an informed decision as to whether more in-depth detailed risk assessment* is necessary.

What do I do if my site is in a moderate or high risk area?

Generally, we recommend that a detailed UXO desk study and risk assessment is undertaken for sites in a moderate or high UXB risk area.

Similarly, if your site is near to a designated Luftwaffe target or bombing decoy then additional detailed research is recommended.

More often than not, this further detailed research will conclude that the potential for a significant UXO hazard to be present on your site is actually low.

Never plan site work or undertake a risk assessment using these maps alone. More detail is required, particularly where there may be a source of UXO from other military operations which are not reflected on these maps.

If my site is in a low risk area, do I need to do anything?

If both the map and other research confirms that there is a low potential for UXO to be present on your site then, subject to your own comfort and risk tolerance, works can proceed with no special precautions.

A low risk really means that there is no greater probability of encountering UXO than anywhere else in the UK.

If you are unsure whether other sources of UXO may be present, you can ask for one of our **pre-desk study assessments (PDSA)**

If I have any questions, who do I contact?

tel: **+44 (0) 1993 886682**

email: **uxo@zetica.com**

web: **www.zeticauxo.com**

The information in this UXB risk map is derived from a number of sources and should be used in conjunction with the accompanying notes on our website: **(https://zeticauxo.com/downloads-and-resources/risk-maps/)**

Zetica cannot guarantee the accuracy or completeness of the information or data used and cannot accept any liability for any use of the maps. These maps can be used as part of a technical report or similar publication, subject to acknowledgment. The copyright remains with Zetica Ltd.

It is important to note that this map is not a UXO risk assessment and should not be reported as such when reproduced.

*Preliminary and detailed UXO risk assessments are advocated as good practice by industry guidance such as CIRIA C681 'Unexploded Ordnance (UXO), a guide for the construction industry'.

Geology 1:50,000 Maps

This report contains geological map extracts taken from the BGS Digital Geological map of Great Britain at 1:50,000 scale and is designed for users carrying out preliminary site assessments who require geological maps for the area around the site. This mapping may be more up to date than previously published paper maps.
The various geological layers - artificial and landslip deposits, superficial geology and solid (bedrock) geology are displayed in separate maps, but superimposed on the final 'Combined Surface Geology' map. All map legends feature on this page. Not all layers have complete nationwide coverage, so availability of data for relevant map sheets is indicated below.

LANDMARK INFORMATION GROUP®

Artificial Ground and Landslip

Artificial ground is a term used by BGS for those areas where the ground surface has been significantly modified by human activity. Information about previously developed ground is especially important, as it is often associated with potentially contaminated material, unpredictable engineering conditions and unstable ground.

Artificial ground includes:

- Made ground - man-made deposits such as embankments and spoil heaps on the natural ground surface.
- Worked ground - areas where the ground has been cut away such as quarries and road cuttings.
- Infilled ground - areas where the ground has been cut away then wholly or partially backfilled.
- Landscaped ground - areas where the surface has been reshaped.
- Disturbed ground - areas of ill-defined shallow or near surface mineral workings where it is impracticable to map made and worked ground separately.

Mass movement (landslip) deposits on BGS geological maps are primarily superficial deposits that have moved down slope under gravity to form landslips. These affect bedrock, other superficial deposits and artificial ground. The dataset also includes foundered strata, where the ground has collapsed due to subsidence.

LANDMARK INFORMATION GROUP®

Superficial Geology

Superficial Deposits are the youngest geological deposits formed during the most recent period of geological time, the Quaternary, which extends back about 1.8 million years from the present.

They rest on older deposits or rocks referred to as Bedrock. This dataset contains Superficial deposits that are of natural origin and 'in place'. Other superficial strata may be held in the Mass Movement dataset where they have been moved, or in the Artificial Ground dataset where they are of man-made origin.

Most of these Superficial deposits are unconsolidated sediments such as gravel, sand, silt and clay, and onshore they form relatively thin, often discontinuous patches or larger spreads.

LANDMARK INFORMATION GROUP®

Bedrock and Faults

Bedrock geology is a term used for the main mass of rocks forming the Earth and are present everywhere, whether exposed at the surface in outcrops or concealed beneath superficial deposits or water.

The bedrock has formed over vast lengths of geological time ranging from ancient and highly altered rocks of the Proterozoic, some 2500 million years ago, or older, up to the relatively young Pliocene, 1.8 million years ago.

The bedrock geology includes many lithologies, often classified into three types based on origin: igneous, metamorphic and sedimentary.

The BGS Faults and Rock Segments dataset includes geological faults (e.g. normal, thrust), and thin beds mapped as lines (e.g. coal seam, gypsum bed). Some of these are linked to other particular 1:50,000 Geology datasets, for example, coal seams are part of the bedrock sequence, most faults and mineral veins primarily affect the bedrock but cut across the strata and post date its deposition.

Combined Surface Geology

The Combined Surface Geology map combines all the previous maps into one combined geological overview of your site.

Please consult the legends to the previous maps to interpret the Combined "Surface Geology" map.

Additional Information

More information on 1:50,000 Geological mapping and explanations of rock classifications can be found on the BGS website. Using the LEX Codes in this report, further descriptions of rock types can be obtained by interrogating the 'BGS Lexicon of Named Rock Units'. This database can be accessed by following the 'Information and Data' link on the BGS website.

Section 1 – Mining activity and geology

Past underground mining
No past mining recorded.

Probable unrecorded shallow workings
None.

Spine roadways at shallow depth
No spine roadway recorded at shallow depth.

Mine entries
None recorded within 100 metres of the enquiry boundary.

Abandoned mine plan catalogue numbers
None available.

Outcrops
No outcrops recorded.

Geological faults, fissures and breaklines
No faults, fissures or breaklines recorded.

Opencast mines
None recorded within 500 metres of the enquiry boundary.

Coal Authority managed tips
None recorded within 500 metres of the enquiry boundary.

Copyright © 2022 The Coal Authority

Section 2 – Investigative or remedial activity

Please refer to the 'Summary of findings' map (on separate sheet) for details of any activity within the area of the site boundary.

Site investigations
None recorded within 50 metres of the enquiry boundary.

Remediated sites
None recorded within 50 metres of the enquiry boundary.

Coal mining subsidence
The Coal Authority has not received a damage notice or claim for the subject property, or any property within 50 metres of the enquiry boundary, since 31 October 1994.

There is no current Stop Notice delaying the start of remedial works or repairs to the property.

The Coal Authority is not aware of any request having been made to carry out preventive works before coal is worked under section 33 of the Coal Mining Subsidence Act 1991.

Mine gas
None recorded within 500 metres of the enquiry boundary.

Mine water treatment schemes
None recorded within 500 metres of the enquiry boundary.

Copyright © 2022 The Coal Authority

Section 3 – Licensing and future mining activity

Future underground mining
None recorded.

Coal mining licensing
None recorded within 200 metres of the enquiry boundary.

Court orders
None recorded.

Section 46 notices
No notices have been given, under section 46 of the Coal Mining Subsidence Act 1991, stating that the land is at risk of subsidence.

Withdrawal of support notices
The property is not in an area where a notice to withdraw support has been given.

The property is not in an area where a notice has been given under section 41 of the Coal Industry Act 1994, cancelling the entitlement to withdraw support.

Payments to owners of former copyhold land
The property is not in an area where a relevant notice has been published under the Coal Industry Act 1975/Coal Industry Act 1994.

Copyright © 2022 The Coal Authority

Section 4 – Further information

Based on the responses in this report, no further information has been highlighted.

Future development

If development proposals are being considered, technical advice relating to both the investigation of coal and former coal mines and their treatment should be obtained before beginning work on site. All proposals should apply specialist engineering practice required for former mining areas. No development should be undertaken that intersects, disturbs or interferes with any coal or coal mines without first obtaining the permission of the Coal Authority.

MINE GAS: Please note, if there are no recorded instances of mine gas within 500m of the enquiry boundary, this does not mean that mine gas is not present within the vicinity. The Coal Authority Mine Gas data is limited to only those sites where a Mine Gas incident has been recorded. Developers should be aware that the investigation of coal seams, mine workings or mine entries may have the potential to generate and/or displace underground gases. Associated risks both to the development site and any neighbouring land or properties should be fully considered when undertaking any ground works. The need for effective measures to prevent gases migrating onto any land or into any properties, either during investigation or remediation work, or after development must also be assessed and properly addressed. In these instances, the Coal Authority recommends that a more detailed Gas Risk Assessment is undertaken by a competent assessor.

Copyright © 2022 The Coal Authority

Section 5 – Data definitions

The datasets used in this report have limitations and assumptions within their results. For more guidance on the data and the results specific to the enquiry boundary, please **call us on 0345 762 6848** or **email us at groundstability@coal.gov.uk.**

Past underground coal mining

Details of all recorded underground mining relative to the enquiry boundary. Only past underground workings where the enquiry boundary is within 0.7 times the depth of the workings (zone of likely physical influence) allowing for seam inclination, will be included.

Probable unrecorded shallow workings

Areas where the Coal Authority believes there to be unrecorded coal workings that exist at or close to the surface (less than 30 metres deep).

Spine roadways at shallow depth

Connecting roadways either, working to working, or, surface to working, both in-seam and cross measures that exist at or close to the surface (less than 30 metres deep), either within or within 10 metres of the enquiry boundary.

Mine entries

Details of any shaft or adit either within, or within 100 metres of the enquiry boundary including approximate location, brief treatment details where known, the mineral worked from the mine entry and conveyance details where the mine entry has previously been sold by the Authority or its predecessors British Coal or the National Coal Board.

Abandoned mine plan catalogue numbers

Plan numbers extracted from the abandoned mines catalogue containing details of coal and other mineral abandonment plans deposited via the Mines Inspectorate in accordance with the Coal Mines Regulation Act and Metalliferous Mines Regulation Act 1872. A maximum of 9 plan extents that intersect with the enquiry boundary will be included. This does not infer that the workings and/or mine entries shown on the abandonment plan will be relevant to the site/property boundary.

Outcrops

Details of seam outcrops will be included where the enquiry boundary intersects with a conjectured or actual seam outcrop location (derived by either the British Geological Survey or the Coal Authority) or intersects with a defined 50 metres buffer on the coal (dip) side of the outcrop. An indication of whether the Coal Authority believes the seam to be of sufficient thickness and/or quality to have been worked will also be included.

Geological faults, fissures and breaklines

Geological disturbances or fractures in the bedrock. Surface fault lines (British Geological Survey derived data) and fissures and breaklines (Coal Authority derived data) intersecting with the enquiry boundary will be included. In some circumstances faults, fissures or breaklines have been known to contribute to surface subsidence damage as a consequence of underground coal mining.

Copyright © 2022 The Coal Authority

Opencast mines
Opencast coal sites from which coal has been removed in the past by opencast (surface) methods and where the enquiry boundary is within 500 metres of either the licence area, site boundary, excavation area (high wall) or coaling area.

Coal Authority managed tips
Locations of disused colliery tip sites owned and managed by the Coal Authority, located within 500 metres of the enquiry boundary.

Site investigations
Details of site investigations within 50 metres of the enquiry boundary where the Coal Authority has received information relating to coal mining risk investigation and/or remediation by third parties.

Remediated sites
Sites where the Coal Authority has undertaken remedial works either within or within 50 metres of the enquiry boundary following report of a hazard relating to coal mining under the Coal Authority's Emergency Surface Hazard Call Out procedures.

Coal mining subsidence
Details of alleged coal mining subsidence claims made since 31 October 1994 either within or within 50 metres of the enquiry boundary. Where the claim relates to the enquiry boundary confirmation of whether the claim was accepted, rejected or whether liability is still being determined will be given. Where the claim has been discharged, whether this was by repair, payment of compensation or a combination of both, the value of the claim, where known, will also be given.

Details of any current 'Stop Notice' deferring remedial works or repairs affecting the property/site, and if so the date of the notice.

Details of any request made to execute preventative works before coal is worked under section 33 of the Coal Mining Subsidence Act 1991. If yes, whether any person withheld consent or failed to comply with any request to execute preventative works.

Mine gas
Reports of alleged mine gas emissions received by the Coal Authority, either within or within 500 metres of the enquiry boundary that subsequently required investigation and action by the Coal Authority to mitigate the effects of the mine gas emission. Please note, if there are no recorded instances of mine gas reported, this does not mean that mine gas is not present within the vicinity. The Coal Authority Mine Gas data is limited to only those sites where a Mine Gas incident has been recorded.

Copyright © 2022 The Coal Authority

Mine water treatment schemes
Locations where the Coal Authority has constructed or operates assets that remove pollutants from mine water prior to the treated mine water being discharged into the receiving water body.

These schemes are part of the UK's strategy to meet the requirements of the Water Framework Directive. Schemes fall into 2 basic categories: Remedial – mitigating the impact of existing pollution or Preventative – preventing a future pollution incident.

Mine water treatment schemes generally consist of one or more primary settlement lagoons and one or more reed beds for secondary treatment. A small number are more specialised process treatment plants.

Future underground mining
Details of all planned underground mining relative to the enquiry boundary. Only those future workings where the enquiry boundary is within 0.7 times the depth of the workings (zone of likely physical influence) allowing for seam inclination will be included.

Coal mining licensing
Details of all licenses issued by the Coal Authority either within or within 200 metres of the enquiry boundary in relation to the under taking of surface coal mining, underground coal mining or underground coal gasification.

Court orders
Orders in respect of the working of coal under the Mines (Working Facilities and Support) Acts of 1923 and 1966 or any statutory modification or amendment thereof.

Section 46 notices
Notice of proposals relating to underground coal mining operations that have been given under section 46 of the Coal Mining Subsidence Act 1991.

Withdrawal of support notices
Published notices of entitlement to withdraw support and the date of the notice. Details of any revocation notice withdrawing the entitlement to withdraw support given under Section 41 of the Coal Industry Act 1994.

Payment to owners of former copyhold land
Relevant notices which may affect the property and any subsequent notice of retained interests in coal and coal mines, acceptance or rejection notices and whether any compensation has been paid to a claimant.

LANDMARK INFORMATION GROUP®

Lancashire And Furness

Published 1850

Source map scale - 1:1,056

The 1:1056 scale of Ordnance Survey mapping was adopted from Ireland in 1848 and was used to survey towns with a population of over 4000, plus county towns of lesser population, in those counties mapped at the six-inch scale in 1841-55. The scale was the largest scale at which London was mapped by the Ordnance Survey and a 'skeleton' survey of the capital, showing little more than streets, street names, frontages and altitudes, was undertaken between 1848 and 1850. The majority of the 1:1056 surveys were later replaced by 1:500 surveys; although almost all the remainder were revised at this scale, sometimes more than once before 1895. The type of detail shown on the 1:1056 scale is broadly similar to that on 1:500; the apparent omission of minor details such as sewer access points and street lights may be as much a reflection of the generally earlier date of these plans, as of the specification of the map.

Please note: Due to the partial coverage of Historical Town Plans, it is possible that not all segments within an order will contain mapping. Only the segments that have Town Plan coverage will be generated.

Introduction

The Environment Act 1995 has made site sensitivity a key issue, as the legislation pays as much attention to the pathways by which contamination could spread, and to the vulnerable targets of contamination, as it does the potential sources of contamination.
For this reason, Landmark's Site Sensitivity maps and Datasheet(s) place great emphasis on statutory data provided by the Environment Agency/Natural Resources Wales and the Scottish Environment Protection Agency; it also incorporates data from Natural England (and the Scottish and Welsh equivalents) and Local Authorities; and highlights hydrogeological features required by environmental and geotechnical consultants. It does not include any information concerning past uses of land. The datasheet is produced by querying the Landmark database to a distance defined by the client from a site boundary provided by the client.
In this datasheet the National Grid References (NGRs) are rounded to the nearest 10m in accordance with Landmark's agreements with a number of Data Suppliers.

Natural England Copyright Notice

Site of Special Scientific Interest, National Nature Reserve, Ramsar, Special Protection Area, Special Conservation Area, Marine Nature Reserve data (derived from Ordnance Survey 1:10000 raster) is provided by, and used with the permission of, Natural England who retain the copyright and Intellectual Property Rights for the data.

Scottish Natural Heritage Copyright

Contains SNH information licensed under the Open Government Licence v3.0.

Ove Arup Copyright Notice

The Mining Instability data was obtained on licence from Ove Arup & Partners Limited (for further information, contact mining.review@arup.com). No reproduction or further use of such Data is to be made without the prior written consent of Ove Arup & Partners Limited. The supplied Mining Instability data is derived from publicly available records and other third party sources and neither Ove Arup & Partners nor Landmark warrant the accuracy or completeness of such information or data.

Stantec Copyright Notice

The cavity data presented has been extracted from the PBA (now Stantec UK Ltd) enhanced version of the original DEFRA national cavity databases. Stantec UK Ltd retain the copyright & intellectual property rights in the data. Whilst all reasonable efforts are made to check that the information contained in the cavity databases is accurate we do not warrant that the data is complete or error free. The information is based upon our own researches and those collated from a number of external sources and is continually being augmented and updated by Stantec UK Ltd. In no event shall Stantec UK Ltd or Landmark be liable for any loss or damage including, without limitation, indirect or consequential loss or damage arising from the use of this data.

Radon Potential dataset Copyright Notice

Report Section and Details	Page Number
Summary	-
The Summary section provides an overview of the data contained within the report, detailing the number of data set features or the existence of a data set in relation to the buffer selected. For ease of reference, the report is broken down into 4 sections of data; Mining and Natural Cavities Data, Historical Land Use Information (1:2,500), Historical Land Use Information (1:10,000) and Ground Stability Data (1:50,000).	
Mining and Natural Cavities Data	1
The Mining and Natural Cavities Data section features data sets related to the existence of mining areas and their potential hazards; and details of naturally formed cavities. Data sets within this section are not plotted, with the exception of BGS Recorded Mineral Sites and Potential Mining Areas which feature on the Historical Land Use Information (1:10,000) map.	
Historical Land Use Information (1:2,500)	-
The Historical Land Use Information (1:2,500) section contains data captured from analysis carried out by Landmark of 1:1,250 and 1:2,500 scale historical Ordnance Survey mapping, identifying areas where, historically, the land uses were potentially contaminative. For the purpose of this Envirocheck module, only historical data relating to mining and ground stability has been included and plotted on the corresponding Historical Land Use Information (1:2,500) map. This section also includes the Subterranean Features data set, which details various man-made and man-used underground spaces obtained from the Subterranea Britannica society.	
Historical Land Use Information (1:10,000)	4
The Historical Land Use (1:10,000) section covers data captured from the systematic analysis carried out by Landmark of 1:10, 560 and 1:10,000 scale historical Ordnance Survey mapping dating back to the mid-19th century, identifying potentially contaminative past industrial land uses. For the purpose of this Envirocheck module, only data relating to mining and ground stability has been included and plotted on the accompanying Historical Land Use Information (1:10,000) map.	
Ground Stability Data (1:50,000)	9
The Ground Stability (1:50,000) section includes the BGS Geosure data suite, reporting features to 250m and plotted onto 3 separate maps. Also reported is brine subsidence, brine mining and salt mining data sets, of which Brine Pumping and Salt Mining Related Features are plotted, and subsidence insurance claims and insurance investigations data, which is not plotted.	
Historical Map List	10
The Historical Map List section details the historical mapping that has been analysed for your site, in relation to the Historical Land Use Information sections.
