1. INTRODUCTION

Tier Environmental was commissioned by Brada Developments to undertake a remediation verification an area of land referred to as Moss Nook, located at Heald Green, Manchester, M22 5LS (the "Site").

1.1. Proposed Development

Under current proposals the development will comprise 4 No. warehouse structures/commercial units of ground floor and mezzanine for a total of 1,396m^2 floor space, with associated infrastructure, parking and localised soft landscaping at the end of parking bays, as presented in Appendix A. As such, in accordance with the 'Updated technical background to the CLEA model' (Environment Agency, 2009) and 'Suitable 4 Use Levels' (LQM / CIEH 2015) the proposed generic land use for this development is Commercial / Industrial.

1.2. Objectives

The objectives of this report are:

- To summarise the previous remediation strategy requirements;
- Describe the completed remediation works;
- Provide a statement to confirm whether the remediation works have been carried out to a level sufficient to facilitate discharge of relevant planning conditions.

1.3. Assumptions

The following assumptions are made in this report:

- The previous ground investigation has been conducted with due consideration of known or suspected constraints (including underground services and access constraints).
- Any references to observations of suspected asbestos-containing materials are for information only and should be verified by a suitably qualified asbestos specialist and/or confirmed by laboratory analysis.
- The use of the term 'Topsoil' within this report is based on a visual identification only and that these materials have not been classified in accordance with BS3882:2015.
- The use of the terms 'shallow' and 'deep' within this report (from a geotechnical perspective) assume *typically* between ground level to circa 3.00m below ground level (bgl) for 'shallow' and greater than 3.00m bgl regarded as 'deep';
- There may be other conditions prevailing on the Site which have not been revealed by this investigation and which have not been taken into account by this report.
- Responsibility cannot be accepted for any conditions not revealed by this investigation. Any diagram or opinion on the possible configuration of the findings is conjectural and given for guidance only. Confirmation of intermediate ground conditions should be undertaken if deemed necessary.

This report has been prepared for the sole use of Brada Developments. No other third party may rely upon or reproduce the contents of this report without the written approval of Tier Environmental. If any unauthorised third party comes into possession of this report, they rely on it entirely at their own risk and the authors do not owe them any Duty of Care or Skill.

2. SITE DETAILS AND DESCRIPTION

2.1. Overview

Table 2.1 Current Site Overview.

Site name	Moss Nook, Heald Green
Site address	Moss Nook, Heald Green, Manchester, M22 5LS. A site location plan is included as Drawing No. TE1604-TE-XX-DR-GE-001-V01 within Appendix A
National Grid Reference (NGR)	384218 385901
Approximate Site area	0.42 ha
Site shape	The Site is irregular in shape
Current land use on the Site	The Site currently comprises unoccupied scrubland. There are no existing structures or areas of hardstanding. Access is afforded by a road from the south east; the site is fenced along its perimeter. A mound of material is located in the centre of the site. Underground service drawings have not been provided to Tier Environmental; however, there remains a potential for such features to be present beneath the Site.
Surrounding land uses	The site is set within a mixed commercial and residential area. Manchester Airport lies approximately 1km to the south west of the Site, with the surrounding area between the airport and the Site predominantly occupied with associated car parks, hotels and other businesses. A railway line, and Heald Green station, are located approximately 200m to the east of the Site, beyond which the surrounding land use is mainly residential.
General topography and ground levels	The Site and surrounding area are understood to be relatively flat at approximately 67m AOD.

An aerial photograph (from the Groundsure report) of the Site and site boundary is shown below.

Figure 2.1 Recent Aerial Photograph from Groundsure

3. REMEDIATION STRATEGY

3.1. Previous Reports

The following previous reports pertaining to this Site have been produced by Tier Environmental:

- A Geoenvironmental Appraisal of Land at Moss Nook, Heald Green, by Tier Environmental (Ref: T/12/1105/GA v 1.1, dated September 2012);
- A Remediation Strategy for Land at Moss Nook, Heald Green, by Tier Environmental (Ref: T/12/1105/RS, dated June 2012);
- An Asbestos Assessment for Land at Moss Nook, Heald Green, by Tier Environmental (Ref: T/12/1105/GA/L01, dated July 2016);
- A Preliminary Risk Assessment Report For Moss Nook, Heald Green, Manchester, by Tier Environmental (Ref: TE1604-TE-00-XX-RP-GE-001-V01, dated 17th August 2021);
- A Supplementary Ground Investigation Report For Moss Nook, Heald Green, Manchester, by Tier Environmental (Ref: TE1604-TE-00-XX-RP-GE-002-V01, dated 27th May 2022)

3.2. Human Health Risk Assessment and Outline Remediation Strategy

Tier Environmental completed a ground investigation in April 2012 which comprised drilling of 3 No. Cable Percussive holes; (BH1 to BH3) to a depth of 10.05m bgl, and excavation of 20 No. trial pits (TP1 to TP20) to depths of between 1.20m bgl (TP18) and 4.00m bgl (TP10). A subsequent visit took place in June 2016 comprising 16 No. trial pits within the asbestos impacted area. Upon comparison of soil chemical results against GACs for a commercial/industrial site land use, Tier recorded no exceedances indicating an unlikely risk to current and future site users. In total, 1 No. sample (TP3 at 0.25m bgl) was identified as containing asbestos (chrysotile fibres) during the initial investigation and a second detection of chrysotile fibres was recorded in the Tier 2016 investigation in the same area, reported to be <0.001% w/w.

The results of a supplementary ground investigation indicates that no further asbestos has been reported beyond that encountered at TP3 during the original ground investigation and no measured concentrations of any other potential contaminants of concern have been reported in excess of the GACs protective of a commercial / industrial land use.

It was concluded that the recommendations within the previous Tier Environmental Remediation Strategy were not impacted by the findings of this supplementary investigation and the following remediation strategy remained pertinent:

- General site clearance to include hardstanding, stockpile and vegetation;
- Removal and verification of asbestos hotspot identified within the north of the site;
- Removal and verification of any previously unidentified areas of contamination, where required;
- Backfill of resultant excavations with suitable material.

With respect to controlled waters, the superficial deposits are classed as a Secondary Undifferentiated Aquifer, and the bedrock is classified a Principal Aquifer. The nearest surface water feature is Gately Brook located 40m northeast of the site boundary. The site is not within a Source Protection Zone and there are no potable abstraction records. Tier Environmental have previously determined the risk to controlled waters to be low given the presence of low permeability clay beneath the Site, the results of leachate analysis obtained in 2012 and the general absence of contamination of Made Ground soils.

The results of a supplementary controlled waters risk assessment were that no measured leachable concentrations of potential contaminants of concern represent a potentially significant risk to the controlled waters environment and no further action was required.

3.3. Remediation Strategy

Asbestos Hotspot Removal

A remaining pollutant linkage to human health, identified within the site investigation report, was considered to be from a hotspot at 0.25m bgl in TP3 which recorded the presence of asbestos. The Made Ground in this area is very limited and, as such, this asbestos is considered to be localised. In order to break this pollutant linkage, it was proposed that the hotspot is removed from this area of the site, prior to the earthworks which are required to bring the site to proposed levels. These hotspot soils should be disposed off site to a suitably licensed landfill site. As such, methods of removing these soils are also highlighted below.

The excavation of Made Ground soils in this area will begin with TP3 and extend to the soils outwards. Due to the presence of loose Made Ground soils, the excavation should be assumed to be unstable. Reference should be made to CIRIA 97 Trenching Practice to establish suitable means of support or battering of excavation sides during their removal. Soils exhibiting anthropogenic materials will be removed from the ground, directly to awaiting road haulage trucks for disposal at a suitably licensed landfill site. On site precautions will be required to prevent the spreading of contaminated soils onto the site or surrounding land. The hotspot will be "chased out" incrementally, based upon directions given by the Supervising Engineer (SE). The SE will cease excavation when they are satisfied that all contaminated soils have been removed.

The removal of sufficient soil will be verified by ensuring that remedial targets have been met for the contaminants. Once verification of the excavation has been achieved, suitable material should be imported to backfill the excavation. The absence of asbestos will be taken as the remedial target.

Verification Requirements

In order to ensure that asbestos contaminated soil is removed from the localised area and any previously unidentified areas of contamination (if required), it was proposed that supervision of the excavation will be carried out as follows:

- A visual inspection of the soil will be undertaken. The excavation will be progressed until no visual evidence of contamination remains;
- Soil samples will be taken from the sides and the base of the excavation, prior to infilling, on a 5m grid (including the walls of the excavations). Sample collection will be made by the use of the excavator bucket to 'scrape' the sample locations. The SE will not enter the excavation at any time;
- If, in the experience of the SE, it is thought that the sample is likely to be below remedial targets, the sample will be submitted for laboratory analysis;
- Should the laboratory analysis indicate that the soil samples are below the remedial targets, the excavation will then be passed for backfilling;
- Should the results be greater than the remedial targets, then further "chasing out" of the contamination will be necessary. The onsite observation exercise will be carried out, as detailed above, with samples only being taken from the failed side of the excavation.

The soil to be disposed of off site will need to be taken to a suitably licensed facility with suitable Duty of Care documentation being in place. The Hazardous Waste Regulations (2005) will also need to be complied with.

It will be necessary to include confirmation that suitable disposal took place in the verification report, hence relevant paperwork will be required to be available from the contractor for inspection/copying.

The Asbestos Assessment for Land at Moss Nook, Heald Green, by Tier Environmental (Ref: T/12/1105/GA/L01, dated July 2016) provided the further specifics following the delineation exercise contained therein:

The excavation of Made Ground soils in this area will begin with TP3 and extend to the soils outwards and include the area of TP3C with the extent of the excavation defined by trial pits TPA, TPB, TPD, TPE, TPN and TPP. Due to the presence of loose Made Ground soils, the excavation should be assumed to be unstable. Reference should be made to CIRIA 97 Trenching Practice to establish suitable means of support or battering of excavation sides during their removal. Made Ground soils within this area will be removed from the ground, directly to awaiting road haulage trucks for disposal at a suitably licensed landfill site. On site precautions will be required to prevent the spreading of contaminated soils onto the site or surrounding land. The excavation should be supervised by a Supervising Engineer (SE) to confirm the extent of the excavation and that the contaminated soils have been excavated.

4. REMEDIATION VERIFICATION

4.1. Site Works

Brada Developments instructed removal of all made Ground / Topsoil materials from the area around TP3 such that, in a lateral context, all potentially asbestos impacted materials were effectively removed from the entirety of the area and therefore it was not necessary (or possible) to take any 'side' samples in accordance with the remediation strategy. However, this approach adopted provides increased confidence that any residual source area has been removed.

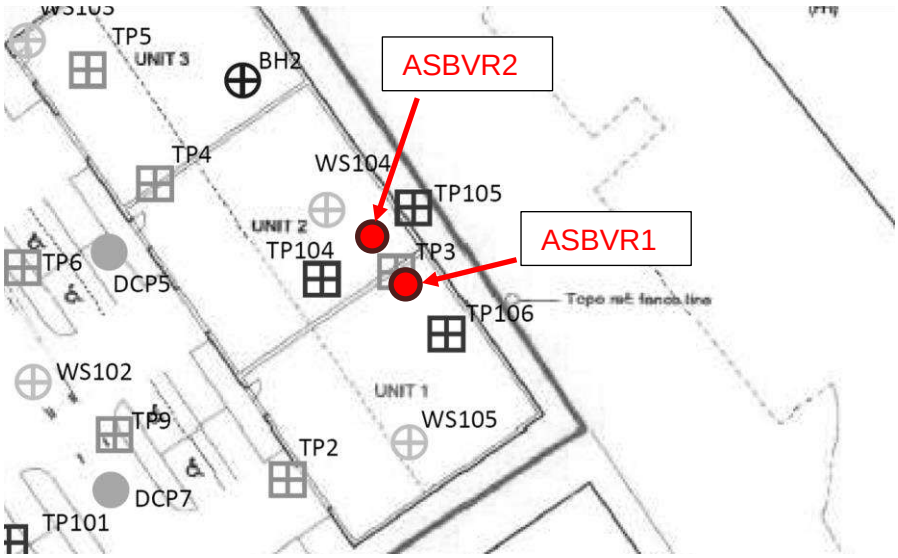

Tier Environmental; however, did obtain two base samples within the former asbestos impacted area on 20th July 2023 (by a suitably qualified and experienced Geoenvironmental engineer) and the following observations were made:

- No Made Ground or residual topsoil remained in the vicinity of TP3;
- Materials representative of Glacial Till were observed at the reduced level surface;
- 2 No. samples were obtained in accordance with the 5m spacing requirements as detailed in the remediation strategy;
- No visual evidence of asbestos impacts was observed;
- Imported stone at the Site appeared to be free from any anthropogenics and appeared to be from a quarried source

4.2. Asbestos Sample Verification

In total, 2 No. samples were obtained from the base (ASB VR1 and ASB VR2) of the area where the topsoil and Made Ground has been stripped around TP3 (see photos included in Appendix C). No side samples were possible as all Made Ground had been removed from the area (so in effect there were no 'sides' to obtain samples from).

Figure 4.1 Asbestos Verification Locations

The laboratory results are presented as Appendix B. In summary, no asbestos was identified in either sample. As such, Tier Environmental consider that the remediation verification works are sufficient to demonstrate that the asbestos impacted materials in the vicinity of TP3 have been effectively removed.

4.3. Soil Waste Removal Details

Waste tickets and off-site soil waste tickets are presented in Appendix E.

5. SITE CERTIFICATION

It has been demonstrated that the asbestos hotspots removal works in the vicinity at TP3 have been completed successfully such that there is no residual risk to the end-users. It is therefore recommended that the relevant planning conditions are discharged for this Site.

6. REGULATORY APPROVALS

The conclusions and recommendations presented above are considered reasonable based on the findings of the site investigations. However, these cannot be guaranteed to gain regulatory approval and, therefore, the report should be passed to the appropriate regulatory authorities and/or other organisations for their comment and approval.

8. GLOSSARY OF TERMS

ACEC	Aggressive Chemical Environment for Concrete (classification)
aOD	Above Ordnance Datum
bgl	Below ground level
BGS	British Geological Survey
BRE	Building Research Establishment
CBR	California Bearing Ratio (test)
COMAH	Control of Major Accident Hazards (regulations)
Designated location	Site (and the ecosystem on that site) protected under national of international legislation. A potential ecological receptor to be considered as part of the assessment of land contamination. Example designated locations include SSSIs (q.v.), SACs (q.v.), national nature reserves, Ramsar sites and bird special protection areas.
DQA	Data Quality Assessment
DQO	Data Quality Objective
DQRA	Detailed Quantitative Risk Assessment
DWS	Drinking Water Standard
EQS	Environmental Quality Standard
GAC	Generic Assessment Criterion
GQA	General Quality Assessment (Environment Agency)
GSV	Gas Screening Value
HCV	Health Criteria Value
IPPC	Integrated Pollution Prevention and Control (regulations)
K_{ow}	Octanol-water partition coefficient
LEL	Lower Explosive Limit
LL	Liquid Limit
LoD	Limit of Detection (analytical)
LoQ	Limit of Quantification (analytical)
Mean Value Test	Statistical test (described in the CIEH Guidance) to estimate the mean value of a normally distributed population of data at a given level of confidence. Normally for contaminated land assessment, the 95th percentile (referred to as the 95%UCL or US95) is applied as a reasonable but conservative estimate of the mean concentration for comparison with the relevant assessment criteria.
Maximum Value Test	Statistical test (described in the CIEH Guidance) to identify whether an elevated concentration within a normally distributed data set forms part of the underlying population from which it has been sampled or whether it is an outlier (such as a localised area of contamination) that merits further consideration.
MC	Moisture Content
NGR	National Grid Reference
NIHHS	Notification of Installations Handling Hazardous Substances (regulations)
OS	Ordnance Survey
PI	Plasticity Index
PID	Photoionisation Detector
PL	Plastic Limit
ppm	Parts per million
ppmv	Parts per million by volume
QA	Quality Assurance
QC	Quality Control
SAC	Special Area of Conservation
SOM	Soil Organic Matter

SPT	Standard Penetration Test
SPZ	Source Protection Zone
SSAC	Site-Specific Assessment Criterion
SSSI	Site of Special Scientific Interest
SVOC	Semi-Volatile Organic Compound
TEF	Toxicity Equivalent Factor
TPH	Total Petroleum Hydrocarbons
TWA	Time Weighted Average
US95	95th percentile estimate of the true mean value of a data population (also known as 95%UCL).
VOC	Volatile Organic Compound

Attention :	Adrian Read
Date :	4th August, 2023
Your reference :	TE1604
Our reference :	Test Report 23/12023 Batch 1
Location :	Moss Nook, Heald Green
Date samples received :	21st July, 2023
Status :	Final Report
Issue :	1

Two samples were received for analysis on 21st July, 2023 of which two were scheduled for analysis. Please find attached our Test Report which should be read with notes at the end of the report and should include all sections if reproduced. Interpretations and opinions are outside the scope of any accreditation, and all results relate only to samples supplied.
All analysis is carried out on as received samples and reported on a dry weight basis unless stated otherwise. Results are not surrogate corrected.

Project Manager

Please include all sections of this report if it is reproduced

Client Name: Tier Environmental
Reference: TE1604
Location: Moss Nook, Heald Green
Contact: Adrian Read

Note:

Asbestos Screen analysis is carried out in accordance with our documented in-house methods PM042 and TM065 and HSG 248 by Stereo and Polarised Light Microscopy using Dispersion Staining Techniques and is covered by our UKAS accreditation. Detailed Gravimetric Quantification and PCOM Fibre Analysis is carried out in accordance with our documented in-house methods PM042 and TM131 and HSG 248 using Stereo and Polarised Light Microscopy and Phase Contrast Optical Microscopy (PCOM). Asbestos sub-samples are retained for not less than 6 months from the date of analysis unless specifically requested.

The LOQ of the Asbestos Quantification is 0.001% dry fibre of dry mass of sample.

Where the sample is not taken by a Element Materials Technology consultant, Element Materials Technology cannot be responsible for inaccurate or unrepresentative sampling.

Where trace asbestos is reported the amount of asbestos will be <0.1%.

EMT Job No.	Batch	Sample ID	Depth	EMT Sample No.	Analysis	Reason
No deviating sample report results for job 23/12023						

Please note that only samples that are deviating are mentioned in this report. If no samples are listed it is because none were deviating.
Only analyses which are accredited are recorded as deviating if set criteria are not met.

NOTES TO ACCOMPANY ALL SCHEDULES AND REPORTS

EMT Job No.: 23/12023

SOILS and ASH

Please note we are only MCERTS accredited (UK soils only) for sand, loam and clay and any other matrix is outside our scope of accreditation.

Where an MCERTS report has been requested, you will be notified within 48 hours of any samples that have been identified as being outside our MCERTS scope. As validation has been performed on clay, sand and loam, only samples that are predominantly these matrices, or combinations of them will be within our MCERTS scope. If samples are not one of a combination of the above matrices they will not be marked as MCERTS accredited.

It is assumed that you have taken representative samples on site and require analysis on a representative subsample. Stones will generally be included unless we are requested to remove them.

All samples will be discarded one month after the date of reporting, unless we are instructed to the contrary. Asbestos samples are retained for 6 months.

If you have not already done so, please send us a purchase order if this is required by your company.

Where appropriate please make sure that our detection limits are suitable for your needs, if they are not, please notify us immediately.

All analysis is reported on a dry weight basis unless stated otherwise. Limits of detection for analyses carried out on as received samples are not moisture content corrected. Results are not surrogate corrected. Samples are dried at 35°C ±5°C unless otherwise stated. Moisture content for CEN Leachate tests are dried at 105°C ±5°C. Ash samples are dried at 37°C ±5°C.

Where Mineral Oil or Fats, Oils and Grease is quoted, this refers to Total Aliphatics C10-C40.

Where a CEN 10:1 ZERO Headspace VOC test has been carried out, a 10:1 ratio of water to wet (as received) soil has been used.

% Asbestos in Asbestos Containing Materials (ACMs) is determined by reference to HSG 264 The Survey Guide - Appendix 2 : ACMs in buildings listed in order of ease of fibre release.

Sufficient amount of sample must be received to carry out the testing specified. Where an insufficient amount of sample has been received the testing may not meet the requirements of our accredited methods, as such accreditation may be removed.

Negative Neutralization Potential (NP) values are obtained when the volume of NaOH (0.1N) titrated (pH 8.3) is greater than the volume of HCl (1N) to reduce the pH of the sample to 2.0 - 2.5. Any negative NP values are corrected to 0.

The calculation of Pyrite content assumes that all oxidisable sulphides present in the sample are pyrite. This may not be the case. The calculation may be an overesitimate when other sulphides such as Barite (Barium Sulphate) are present.

WATERS

Please note we are not a UK Drinking Water Inspectorate (DWI) Approved Laboratory .

ISO17025 accreditation applies to surface water and groundwater and usually one other matrix which is analysis specific, any other liquids are outside our scope of accreditation.

As surface waters require different sample preparation to groundwaters the laboratory must be informed of the water type when submitting samples.

Where Mineral Oil or Fats, Oils and Grease is quoted, this refers to Total Aliphatics C10-C40.

STACK EMISSIONS

Where an MCERTS report has been requested, you will be notified within 48 hours of any samples that have been identified as being outside our MCERTS scope. As validation for Dioxins and Furans and Dioxin like PCBs has been performed on XAD-2 Resin, only samples which use this resin will be within our MCERTS scope.

Where appropriate please make sure that our detection limits are suitable for your needs, if they are not, please notify us immediately.

DEVIATING SAMPLES

All samples should be submitted to the laboratory in suitable containers with sufficient ice packs to sustain an appropriate temperature for the requested analysis. The temperature of sample receipt is recorded on the confirmation schedules in order that the client can make an informed decision as to whether testing should still be undertaken.

SURROGATES

Surrogate compounds are added during the preparation process to monitor recovery of analytes. However low recovery in soils is often due to peat, clay or other organic rich matrices. For waters this can be due to oxidants, surfactants, organic rich sediments or remediation fluids. Acceptable limits for most organic methods are 70 - 130% and for VOCs are 50 - 150%. When surrogate recoveries are outside the performance criteria but the associated AQC passes this is assumed to be due to matrix effect. Results are not surrogate corrected.

DILUTIONS

A dilution suffix indicates a dilution has been performed and the reported result takes this into account. No further calculation is required.

BLANKS

Where analytes have been found in the blank, the sample will be treated in accordance with our laboratory procedure for dealing with contaminated blanks.

NOTE

Data is only reported if the laboratory is confident that the data is a true reflection of the samples analysed. Data is only reported as accredited when all the requirements of our Quality System have been met. In certain circumstances where all the requirements of the Quality System have not been met, for instance if the associated AQC has failed, the reason is fully investigated and documented. The sample data is then evaluated alongside the other quality control checks performed during analysis to determine its suitability. Following this evaluation, provided the sample results have not been effected, the data is reported but accreditation is removed. It is a requirement of our Accreditation Body for data not reported as accredited to be considered indicative only, but this does not mean the data is not valid.
Where possible, and if requested, samples will be re-extracted and a revised report issued with accredited results. Please do not hesitate to contact the laboratory if further details are required of the circumstances which have led to the removal of accreditation.
Laboratory records are kept for a period of no less than 6 years.

REPORTS FROM THE SOUTH AFRICA LABORATORY

Any method number not prefixed with SA has been undertaken in our UK laboratory unless reported as subcontracted.

Measurement Uncertainty

Measurement uncertainty defines the range of values that could reasonably be attributed to the measured quantity. This range of values has not been included within the reported results. Uncertainty expressed as a percentage can be provided upon request.

Customer Provided Information

Sample ID and depth is information provided by the customer.

ABBREVIATIONS and ACRONYMS USED

#	ISO17025 (UKAS Ref No. 4225) accredited - UK.
SA	ISO17025 (SANAS Ref No.T0729) accredited - South Africa
B	Indicates analyte found in associated method blank.
DR	Dilution required.
M	MCERTS accredited.
NA	Not applicable
NAD	No Asbestos Detected.
ND	None Detected (usually refers to VOC and/SVOC TICs).
NDP	No Determination Possible
SS	Calibrated against a single substance
SV	Surrogate recovery outside performance criteria. This may be due to a matrix effect.
W	Results expressed on as received basis.
+	AQC failure, accreditation has been removed from this result, if appropriate, see 'Note' on previous page.
>>	Results above quantitative calibration range. The result should be considered the minimum value and is indicative only. The actual result could be significantly higher.
*	Analysis subcontracted to an Element Materials Technology approved laboratory.
AD	Samples are dried at 35°C ±5°C
CO	Suspected carry over
LOD/LOR	Limit of Detection (Limit of Reporting) in line with ISO 17025 and MCERTS
ME	Matrix Effect
NFD	No Fibres Detected
BS	AQC Sample
LB	Blank Sample
N	Client Sample
TB	Trip Blank Sample
OC	Outside Calibration Range

HWOL ACRONYMS AND OPERATORS USED

HS	Headspace Analysis.
EH	Extractable Hydrocarbons - i.e. everything extracted by the solvent.
CU	Clean-up - e.g. by florisil, silica gel.
1D	GC - Single coil gas chromatography.
Total	Aliphatics & Aromatics.
AL	Aliphatics only.
AR	Aromatics only.
2D	GC-GC - Double coil gas chromatography.
#1	EH_Total but with humics mathematically subtracted
#2	EU_Total but with fatty acids mathematically subtracted
_	Operator - underscore to separate acronyms (exception for +).
+	Operator to indicate cumulative e.g. EH+HS_Total or EH_CU+HS_Total
MS	Mass Spectrometry.

EMT Job No: 23/12023

Test Method No.	Description	Prep Method No. (if appropriate)	Description	ISO 17025 (UKAS/SANAS)	MCERTS (UK soils only)	Analysis done on As Received (AR) or Dried (AD)	Reported on dry weight basis
TM65	Asbestos Bulk Identification method based on HSG 248 Second edition (2021)	PM42	Modified SCA Blue Book V.12 draft 2017 and WM3 1st Edition v1.1:2018. Solid samples undergo a thorough visual inspection for asbestos fibres prior to asbestos identification using TM065.	Yes		AR	

APPENDIX C - PHOTOGRAPHS

Photograph 1: Remedial excavation looking northeast, demonstrating that levels have been reduced onto the natural soils. i.e. no Made Ground in the vicinity of TP3 remains.

Photograph 2: Remedial excavation, natural clay sample location

Photograph 2: Remedial excavation, second natural soil sample location

APPENDIX D - CHEMICAL TEST SAMPLING

Samples were selected by a representative of Tier Environmental during the site investigation works in accordance with the sampling approach described elsewhere in this report.

Samples for chemical analysis

All samples for chemical analysis were placed into clean new containers as summarised in Table 1. Unless explicitly stated elsewhere in this report, no preservatives were used to eliminate the risk that preservatives cause contaminant dissolution or analytical interference. Containers for VOC analysis were fully filled to exclude headspace.

Soil samples were dispensed as soon as possible after collection using reusable stainless steel spatulas, trowels or similar implements.

Ground water samples were collected from boreholes using single-use Teflon bailers or dedicated Waterra tubing with foot valves, except as otherwise noted within this report. Caution was taken to avoid excessive agitation during collection

New disposable gloves were used by the engineer for the collection of each sample.

Reusable equipment was washed down with distilled or deionised water between samples, except where tarry or similarly sticky materials were present. In such cases specific cleaning procedures were adopted as specifically described elsewhere in this report.

All sub-samples taken for chemical analysis were placed into refrigerators or cool boxes containing frozen ice packs immediately after aliquoting. All samples were transferred in cool boxes containing frozen ice packs to the relevant UKAS/MCERTS accredited laboratory as soon as possible. Recommended maximum holding times before analysis are summarised in Table 1.

Table 1. Sample containers and holding times.

Analysis	**Container/special requirements**	**Max. holding time at 4°C before analysis**
Soil and sediment samples		
VOCs	30-60 g brown or green glass jar with VOC-resistant cap and inert cap liner. Must be fully filled.	14 days
TPHCWG	30-60 g brown or green glass jar with VOC-resistant cap and inert cap liner **PLUS** 250-500 g brown or green glass jar with unwaxed cap liner.[1] The former must be fully filled.	14 days
All other organics	250-500 g brown or green glass jar with unwaxed cap liner.	7 days
Inorganics	Air-tight 0.5-2.0 kg plastic container (250-500 g brown or green glass jar may also be used).	14 days[2]
Water samples		
VOCs	40-50 ml glass vial with VOC resistant screw cap and inert liner. Must be fully filled.	14 days
TPHCWG	40-50 ml glass vial with VOC resistant screw cap and inert liner **PLUS** 500-1000 ml brown or green glass bottle with screw cap and unwaxed liner.[1] The former must be fully filled, the latter should be filled if possible.	14 days
All other organics	500-1000 ml brown or green glass bottle with screw cap. Fill if possible.	7 days
Inorganics	500-1000 ml translucent or opaque screw cap plastic *or* brown or green glass bottles. Fill if possible.	14 days[3]

1 The smaller vessel is used for analysis of the volatile components within the TPH mixture and the larger one is for the non-volatile components.

2 14 days is set as a reasonable limit for all routine analyses of soil for those inorganic components vulnerable to chemical and/or biological breakdown. Samples for sulphate analysis are vulnerable to biological sulphate-reduction but can be held for up to 28 days. For total metals, a holding period of up to 6 months is acceptable.

3 14 days applies for all routine analyses of most inorganic components that may be vulnerable to chemical and/or biological reactions. In the specific cases of sulphide, nitrite, nitrate and phosphate analyses, storage time must not exceed 48 hours. For total metals, a holding time of up to 6 months is acceptable.

Tier Environmental standard analytical suites

The analyses included with Tier Environmental's standard analytical suites for soil, soil leachate and water samples are presented in Table 2. Other individual analyses were specified as described within this report.

Table 2. Tier Environmental Standard Analytical Suites.

Parameter	**Sample type**					
	Soil		**Leachate[1]**		**Water**	
		LoD[2] (mg/kg or as stated)		**LoD (µg/l or as stated)**		**LoD (µg/l or as stated)**
Metals and metalloids						
Arsenic	✓	1	✓	10	✓	10
Cadmium	✓	1	✓	5	✓	5
Chromium	✓	1	✓	5	✓	5
Mercury	✓	1	✓	1	✓	1

Zinc	✓	1	✓	8	✓	8
Other inorganics						
Ammonia (as NH_4-N)					✓	15
Total sulphate	✓	100			✓	50 mg/l
Water-soluble sulphate	✓	0.1 g/l				
Hardness (as $CaCO_3$)					✓	1 mg/l
Organics						
Monohydric phenol	✓	1	✓	0.5	✓	0.5
Speciated PAHs (USEPA 16)	✓	0.1	✓	0.01	✓	0.01
Total Organic Carbon	✓	0.1 wt%				
Others						
Electrical conductivity					✓	NA
pH	✓	NA	✓	NA	✓	NA

NA - Not applicable

1 Leachate preparation according to NRA (1994), 10:1 liquid to solid ratio.

2 The table presents the desired limit of detection for the analysis. Higher LoDs may be reported on analytical data sheets due to interference between analytes within specific samples or if the laboratory needed to dilute samples to achieve results within the calibrated range for that instrument.

Analytical QA procedures

Introduction

Quality Assurance (QA) is a system of review and audit that assesses the effectiveness of that product and assures the producer and user that defined standards of quality have been met. If we consider site investigation and chemical analysis, QA is the management system that ensures these measures are in place and working as intended.

QA within the laboratory form part of relevant certification programmes (such as UKAS and MCERTS) and, indeed, will be undertaken in some form by any reputable analyst, whether for a certified technique or not. Laboratory QA/QC is beyond the control of Tier Environmental and will not be considered further in this document, although the relevant laboratory documentation can be obtained upon request. QA must also form part of the design and execution of a site investigation.

Two parameters often used to assess measurement quality objectives are bias and precision. Bias is a systematic deviation in the data. For example, a positive bias (concentrations higher than in reality) would be introduced if sampling bottles were a source of the analyte and this fact was unknown. Precision is the variation in the measurements around a central 'expected' value. This could be due both to real variability in the environmental medium being measured and random errors in the analytical process. Both precision and bias can be assessed by the use of appropriate blanks and replicates within the site investigation programme.

The objectives of the QA activities undertaken in this present site investigation were to recognise and quantify systematic bias within the analytical dataset and to obtain an indication of precision. In environmental samples, much of the observed variability is likely to result from heterogeneity in the sampled medium, particularly for soil and sediment samples.

Such QA practice within the sampling programme is required by current guidance (e.g., Environment Agency report P5-065/TR (2000); Environment Agency LFTGN02 (2002); BS 10175:2001).

Alternative QA procedures to the generic approach presented in this appendix may be specified for a project, provided case-specific justification is given.

QA checking procedure (data validation)

The responsible Engineer and Project Reviewer are required to undertake data validation and provide comment on data quality within the main body of the report(s) issued, when noteworthy matters arise. This QA checking should involve:

Confirming that data reported by the laboratory have achieved the standards specified by the certification scheme (MCERTS or UKAS). This will be indicated on the analytical certificates issued by the laboratory.

Checking that the limit of detection (LoD) and limit of quantification (LoQ) achieved by the laboratory for an individual analyte is appropriate for the purposes of the report. LoD and LoQ will vary dependent upon analyte concentrations, sample matrix properties and interference from co-contaminants.

A check that the reported range of concentrations are reasonable for the analyte. For example, the dissolved concentration of an analyte in a water sample should not exceed saturation. If it does, then this merits further consideration (e.g., was colloidal organic matter or other solid-phase material present or could there have been unobserved free-phase organic liquid?) and explicit comment. At its simplest, there may be a unit error.

Where analysis involves reporting of Tentatively Identified Compounds (TICs; normally by mass spectrometry), the reviewers should check that these might reasonably be expected at the site under consideration. The uncertainties in identification by MS mean that it is not uncommon that TICs are incorrectly assigned. In cases of doubt, the analytical laboratory can re-check the raw data and confirm.

A review of the analytical precision by comparing data obtained for duplicate samples. There is no absolute threshold - variability is entirely dependent upon the sample matrix and manner in which the contaminant has entered the sample. Variability that cannot reasonably be assigned to such factors (for example a very high apparent variability in data for sediment-free water samples) should be reviewed with the laboratory. Variability that is attributable to the sample matrix can nevertheless provide important pointers to improve understanding of contaminant transport pathways and the risks posed by pollutant linkages (e.g., soil heterogeneity, the association of contamination with particular soil fractions, the presence of residual NAPL within soil pores or the role of suspended sediments in contaminant transport).

Confirmation that no errors have been introduced by data transcription, unit conversion or corrections between preliminary and certificates issued by the laboratory. The reviewer should audit a proportion (typically 5-10%) of all data from the original (final) certificates of analysis through to the equivalent values in the report for those specific samples.

In is important to consult the analytical laboratory if apparent QA issues arise. Many apparent concerns can be adequately resolved on the basis of revisiting the raw analytical data or by obtaining a better understanding of the inherent limitations of the analysis for a particular matrix or sample type.
