

## **Appendix C** Extract of Soiltechnics Ground Investigation report (August 2023), including Infiltration Testing and Trial Pit information

# 1 Executive summary

## General

We recommend the following executive summary is not read in isolation to the main report which follows.

## Site description, history and development proposals

The site is located within the predominantly residential/commercial area of West Didsbury approximately 6km south of Manchester City Centre. The site lies at the western corner of the Lapwing Lane and Palatine Road crossroads at postal address M20 3ZA.

The site was first developed in 1893 with a large building in the eastern corner matching the current site layout. Since 1893 several smaller buildings have been present in the north and west of the site which were subsequently demolished. The reported use of the site is a public house, residential and school. Offsite historic land uses include a town/corporation yard (adjacent to north west), railway line (adjacent to east), electrical substation (c.10m north) and a garage (c.135m north east).

We understand the site will be redeveloped for residential use comprising apartment blocks of twenty-four 1-bed and thirteen 2-bed retirement living units with shared landscaped space. The blocks are to be 2.5-3-stories in height.

## Ground conditions encountered

| Table summarising soil types |                         |                     |               |                                                    |
|------------------------------|-------------------------|---------------------|---------------|----------------------------------------------------|
| Strata                       | Depth to top (m)        | Depth to bottom (m) | Thickness (m) | Summary description                                |
| Made Ground                  | 0.0                     | 0.6 – >1.2          | 0.6 – >1.2    | Light grey to brown gravels of limestone and brick |
| Glaciofluvial Sheet Deposits | 0.6 – 0.9, locally >1.2 | >3.2                | >2.5          | Light grey to brown gravelly slightly clayey sand. |

## Foundation solution

In our opinion the naturally deposited Glaciofluvial Sheet Deposits will adequately support the proposed buildings on concrete strip / trench fill type foundations. Further details are provided within Section 7 of the report.

Ground bearing floor slabs can be adopted at this site where Made Ground and Topsoil deposits are fully removed within the footprint of the building. In areas where ground floors are elevated requiring in excess of 600mm of fills, or where it is impracticable to remove Made Ground, then we recommend the use of a suspended ground floor with a sub floor void determined following NHBC Standards, Chapter 4.2.

Based on laboratory test results, a subgrade CBR value of 3% can be deduced at formation level. A concrete class of DS-1 and ACEC-1 can be adopted on site.

Initial infiltration testing was undertaken in 2021. Further on-site infiltration testing with observations made over an extended period of time was undertaken in October 2022, to allow production of more accurate infiltration rates.

In summary infiltration rates of  $\sim 1.0 \times 10^{-5}$  m/s were recorded in TP101 and TP102 in the SW of the site. Slower infiltration rates of  $< 1.0 \times 10^{-5}$  m/s were recorded elsewhere, with a site-wide average of  $9.55 \times 10^{-6}$  m/s.

## Chemical and gaseous contamination

No access could be gained to the north and east of the site during the original 2021 investigation due to the presence of the public house. The western half of the pub was since demolished and further trial pits were undertaken in previously inaccessible areas to assess the wider extent of potential ground contamination.

Elevated PAH and TPH concentrations were identified on site during the 2021 and 2022 investigations. We are, therefore, of the opinion that the site represents a moderate risk of causing harm to the health of future end users based on current development proposals.

There is little soil onsite which could be utilised as a suitable growing medium for plants. The importation of soils for lawns and soft landscaping would be required. Such material will require verification prior to import, to ensure it is suitable for use with respect to concentrations of chemical contaminants.

No significant sources of gaseous contamination have been identified, therefore, do not consider there to be a gas risk on site.

Barrier pipes are likely to be a requirement on site due to the PAHs identified, however, we recommend Untied Utilities are consulted to determine their requirements.

## Landfill classification

The site wide Made Ground (comprising sandy gravels of limestone and brick) are suitable for disposal at a **non-hazardous** landfill but cannot be classified as inert owing to the presence of elevated mineral oil within the soils.

## 4 Fieldwork

|     |                        |
|-----|------------------------|
| 4.1 | General                |
| 4.2 | Site restrictions      |
| 4.3 | Exploratory trial pits |
| 4.4 | Sampling strategies    |

### 4.1 General

- 4.1.1 The original fieldwork was carried out on 16<sup>th</sup> April 2021 has comprised five trial pits to a maximum depth of 3.2m below ground level (bgl). Additional fieldwork carried out on 6<sup>th</sup> and 7<sup>th</sup> October 2022 comprised a further six trial pits (one hand dug) to a maximum depth of 2.0m below ground level.
- 4.1.2 A plan of the site showing observed/existing site features and position of exploratory points is presented on Drawing 02.
- 4.1.3 The extent of fieldwork activities and position of exploratory points were determined by Soiltechnics.
- 4.1.4 Exploratory points were positioned to avoid known locations of underground services, to avoid possible location of proposed foundations but were also positioned to provide a reasonable coverage of the site. Prior to commencement of exploratory excavations an electronic cable locating tool was used to scan the area of the excavation. If we received a response to this equipment then the excavation would be relocated.
- 4.1.5 All soils exposed in excavations were described in accordance with BS EN ISO 14688 '*Identification and Classification of soil*' and BS EN ISO 14689 '*Identification and classification of rock*'.

### 4.2 Site restrictions

- 4.2.1 There were no significant onsite restrictions at the time of investigation with the exception of the presence of the remaining parts of the former public house buildings in both 2021 and 2022.

### 4.3 Exploratory trial pits

- 4.3.1 Trial pits TP01 to TP05 (2021) and TP101 to TP105 (2022) were excavated to a maximum depth of 3.2m using a rubber tyred excavator, while TP106 was excavated using hand held digging equipment to a depth of 0.7m. Surface asphalt was initially broken out using hydraulic breaking equipment fixed to the excavator. The excavations were backfilled with excavated material compacted using the back of the excavator bucket. Whilst we attempted to reinstate the excavation to its original condition some short-term settlement of the backfilling materials may occur. Asphalt surfacing was not replaced.

- 4.3.2 Sampling and logging was carried out as trial pit excavations proceeded but were not entered at depths exceeding 1.2m, or where trial pit sides were deemed unstable. The density of granular soils encountered in excavations was gauged by the ease of excavation.
- 4.3.3 Soil samples for subsequent laboratory determination of concentration of chemical contaminants were taken from the sides of trial pits using clean stainless-steel equipment and stored in new plastic containers, which were labelled and sealed. The stainless-steel sampling equipment was cleaned with deionised water between sampling points. Samples from below access depth into trial pits were taken as a sub sample from soil contained in the excavator bucket, discarding any soil, which may have been in contact with the bucket. If as a consequence of visual or olfactory evidence, a sample was suspected to be contaminated by organic material, the sample was stored in an amber glass jar with a PTFE sealing washer.
- 4.3.4 Soil samples for subsequent laboratory ‘classification’ testing were taken from the side of trial pits or from bulk samples taken from the excavator bucket. The sample was immediately placed in a plastic bag and subsequently sealed and labelled. Samples for determination of water content were placed in sealable tubs and appropriately labelled. Soil samples were obtained to meet Category A and quality class 3 to 5 as described in BS EN 1997-2:2007 (table 3.1) sufficient for laboratory testing being considered. Sample sizes were also appropriate for the laboratory test being considered (refer BS EN 1997-2:2007 annex L).
- 4.3.5 Copies of trial pit borehole logs are presented within Appendix D.
- 4.3.6 Infiltration testing carried out in trial pits**
- 4.3.6.1 Soil infiltration tests were carried out in trial pits TP02 and TP04 at depths between 1.12m and 1.82m in 2021 during our original 2021 investigations, and between TP101 to TP104 at depths between 0.90m and 2.0m during our 2022 investigation. Infiltration tests were carried out following the procedures described in the Building Research Establishment (BRE) DG 365 (2016) “*Soakaway Design*”. Records of test results and calculations to determine a soil infiltration rate are presented in Appendix C.
- 4.3.6.2 During 2021 investigations the rate at which water placed in each trial pit dissipated was slow and a maximum of three test cycles could not be carried out in TP02 during one day of fieldwork (the BRE document recommends three full test cycles).
- 4.3.6.3 In 2022, three test cycles could be carried out in TP102 and TP103 during two days of fieldwork. Two test cycles were carried out in TP101 and TP104 during two days of fieldwork, with one cycle completed in TP04 in one day of fieldwork. Test results have been used to produce a soil infiltration rate for each test cycle, using the method described in the BRE publication.

## **4.4 Sampling strategies**

### **4.4.1 Geotechnical**

4.4.1.1 In general we adopted a judgemental sampling strategy in relation to geotechnical aspects of the investigation. The location and frequency of sampling was carried out in consideration of the following:

- i) Topography
- ii) Geology (including Made Ground)
- iii) Nature of development proposals

### **4.4.2 Environmental**

4.4.2.1 Details of sampling with respect to contamination issues are described in Section 8.

### **4.4.3 Sample retention**

4.4.3.1 Samples are stored for a period of one month following issue of this report, unless otherwise requested.

## Soil infiltration test (following BRE Digest 365 2016)

| Location                                                | Cycle | Test date  | Dimensions (m) |
|---------------------------------------------------------|-------|------------|----------------|
| TP02                                                    | 1     | 16/04/2021 | 0.70m x 2.00m  |
| <b>Depth at start of test (m)</b>                       |       |            |                |
| 1.8                                                     |       |            |                |
| <b>Groundwater observations (at time of excavation)</b> |       |            |                |
| No groundwater encountered.                             |       |            |                |

$$f = \frac{V_{p75-25}}{a_{p50} \times t_{p75-25}}$$

|              |                                                                                     |                                    |
|--------------|-------------------------------------------------------------------------------------|------------------------------------|
| $V_{p75-25}$ | Effective storage volume of water between 75% (dp75) and 25% (dp25) effective depth | 0.147m <sup>3</sup> m <sup>3</sup> |
| $a_{p50}$    | Internal surface area up to 50% effective depth and including the base              | 1.967m <sup>2</sup> m <sup>2</sup> |
| $t_{p75-25}$ | Time for the water level to fall from 75% to 25% effective depth                    | 4440 s                             |

|          |                               |                     |
|----------|-------------------------------|---------------------|
| <b>f</b> | <b>Soil infiltration rate</b> | <b>1.68E-05 m/s</b> |
|----------|-------------------------------|---------------------|

### Soil infiltration test (following BRE Digest 365 2016)

| Location | Cycle | Test date  | Dimensions (m) |
|----------|-------|------------|----------------|
| TP02     | 2     | 16/04/2021 | 0.70m x 2.00m  |

| Depth at start of test (m) | Groundwater observations (at time of excavation) |
|----------------------------|--------------------------------------------------|
| 1.8                        | No groundwater encountered.                      |

Insufficient infiltration over 90 minutes of monitoring therefore unable to calculate soil infiltration rate.

## Soil infiltration test (following BRE Digest 365 2016)

| Location                          | Cycle                                                   | Test date  | Dimensions (m) |
|-----------------------------------|---------------------------------------------------------|------------|----------------|
| TP04                              | 1                                                       | 16/04/2021 | 0.70m x 2.50m  |
| <b>Depth at start of test (m)</b> |                                                         |            |                |
| 2                                 | <b>Groundwater observations (at time of excavation)</b> |            |                |
|                                   | No groundwater encountered.                             |            |                |

$$f = \frac{V_{p75-25}}{a_{p50} \times t_{p75-25}}$$

|              |                                                                                     |                                   |
|--------------|-------------------------------------------------------------------------------------|-----------------------------------|
| $V_{p75-25}$ | Effective storage volume of water between 75% (dp75) and 25% (dp25) effective depth | 0.35m <sup>3</sup> m <sup>3</sup> |
| $a_{p50}$    | Internal surface area up to 50% effective depth and including the base              | 3.03m <sup>2</sup> m <sup>2</sup> |
| $t_{p75-25}$ | Time for the water level to fall from 75% to 25% effective depth                    | 14235 s                           |

## Soil infiltration test (following BRE Digest 365 2016)

| Location | Cycle | Test date  | Dimensions (m) |
|----------|-------|------------|----------------|
| TP103    | 2     | 06/10/2022 | 0.70m x 2.10m  |

| Depth at start of test (m) | Groundwater observations (at time of excavation)                                                                                                               |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0.9                        | No groundwater encountered. After 200mins the pit sides collapsed, significantly affecting the test. Data extrapolated from last measurement prior to collapse |

$$f = \frac{V_{p75-25}}{a_{p50} \times t_{p75-25}}$$

|                                                                                     |          |                |
|-------------------------------------------------------------------------------------|----------|----------------|
| $V_{p75-25}$                                                                        |          |                |
| Effective storage volume of water between 75% (dp75) and 25% (dp25) effective depth | 0.8085   | m <sup>3</sup> |
| $a_{p50}$                                                                           |          |                |
| Internal surface area up to 50% effective depth and including the base              | 5        | m <sup>2</sup> |
| $t_{p75} - t_{p25}$                                                                 |          |                |
| Time for the water level to fall from 75% to 25% effective depth                    | 27780    | s              |
| f                                                                                   |          |                |
| Soil infiltration rate                                                              | 6.40E-06 | m/s            |

### Soil infiltration test (following BRE Digest 365 2016)

| Location | Cycle | Test date  | Dimensions (m) |
|----------|-------|------------|----------------|
| TP103    | 3     | 06/10/2022 | 0.70m x 2.10m  |

| Depth at start of test (m) | Groundwater observations (at time of excavation) |
|----------------------------|--------------------------------------------------|
| 0.95                       | No groundwater encountered.                      |

Insufficient infiltration over 77 minutes of monitoring therefore unable to calculate soil infiltration rate.

## Soil infiltration test (following BRE Digest 365 2016)

| Location | Cycle | Test date  | Dimensions (m) |
|----------|-------|------------|----------------|
| TP104    | 1     | 07/10/2022 | 0.70m x 2.10m  |

| Depth at start of test (m) | Groundwater observations (at time of excavation)                                                                                                              |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0.91                       | No groundwater encountered. Significant period of inclement weather after 120mins. Test terminated and data extrapolated from last measurement prior to event |

$$f = \frac{V_{p75-25}}{a_{p50} \times t_{p75-25}}$$

|                                                                                     |          |                |

## Water observations

Described at foot of log and shown in the 'water strike' column.

▼ Water level observed after specified delay in drilling

∇ Water strike

## Density

Density recorded in brackets determined by qualitative field assessment or inferred from density testing and soil descriptions from across the site (i.e.: [Medium dense]).

Good Morning Ben,

Thank you for your Pre Development Enquiry, please see our response below:

### **UU REF – 04799999 – Ww PDE - Lapwing Lane, Didsbury**

I can confirm United Utilities has no objections in principal to your proposals of 2.7 l/s to the combined sewer network.

Regards

Anthony

## **Appendix K** Preliminary Drainage Layout

Town Hall

ESS's

LAPWING LANE

RALEIGH CLOSE

PALATINE ROAD

**Surface Water Strategy:**

**Existing Drainage**  
Existing ACO drain present at site entrance appears to receive small catchment within site boundary. New linear drain to be installed across site access with connection to attenuation tank.

**Exceedance Flows**  
Beyond the capacity of the proposed surface water network and attenuation, exceedance flows would be directed away from the proposed building and towards areas of landscaping, and/or car parking, wherever possible. Beyond the capacity of the site, flows would continue offsite as per existing conditions.

**Cellular Attenuation**  
Cellular tank to receive flows from external hard paving and roof catchments. Chambers immediately upstream of tank to include silt traps

**Maintenance**  
Geocellular Attenuation to be fitted with access tunnels for maintenance of feature. Any vented covers to be in accordance with manufacturer recommendations.

**Surface Water Strategy:**

**Catchment**  
Parking area of adjacent building assumed to drain independently to existing gullies within adjacent development parking area.

**Surface Water Strategy:**

**Flow Control**  
Proposed surface water control chamber to restrict flows up to 100yr return period. Controlled flows are to discharge into United Utilities' adopted combined network within Palatine Road.

**Surface Water Discharge**  
Attenuated surface water flows to discharge to existing combined sewer beneath Palatine Road as agreed with United Utilities.

**Foul Water Strategy:**

Foul flows generated by the proposed site to connect to the existing adopted combined sewer network in Palatine Road.

**Area Summary Schedule**

|                               |          |
|-------------------------------|----------|
| Total Site Area               | 0.306 ha |
| Impervious Catchment          | 0.182 ha |
| Existing Impervious Catchment | 0.216 ha |

**Pre-Development Runoff**

The site is predominantly brownfield however the equivalent greenfield runoff rates have been assessed for the 'net developable area' using the FFI Method. The whole site brownfield rate has been calculated using the Modified Rational Method (MRM).

**Existing Runoff Rates**

| Return Period | Equivalent Greenfield Rate (l/s) (0.306 ha) | Brownfield Rate (l/s) (0.216 ha) |
|---------------|---------------------------------------------|----------------------------------|
| 2yr           | 1.0                                         | 27.9                             |
| 30yr          | 2.2                                         | 51.0                             |
| 100yr         | 2.7                                         | 62.5                             |

**Attenuation Summary**

**Cellular Storage Tank**

|                   |                             |
|-------------------|-----------------------------|
| Ownership         | Private                     |
| Catchment         | 0.182 ha                    |
| Hydraulic Control | Hydrobrake @ IL             |
| Porosity          | CTL SHE-0066-2600-1900-2600 |
| Tank Dimensions:  | 26.0m x 4.5m x 0.8m         |

**Total 100yr+45% Volume required: 90.8 m³**  
**Total 100yr+45% Peak Discharge: 2.7 l/s**

**Notes**

- The development proposes the construction of a new retirement living complex comprising 24 one-bedroom and 13 two-bedroom apartments. The proposed development has been assessed in line with the National Planning Policy Framework, to allow the planning application to be progressed and to show that the development can be undertaken in an acceptable manner from a flood risk perspective.
- The proposed development is located within Flood Zone 1 and is not known to be susceptible to flooding from groundwater, infrastructure or artificial sources. Shallow pluvial flooding is shown in the 0.1% annual exceedance event, but this can be mitigated through the surface water management plan.
- To ensure the development is safe throughout its lifetime, the surface water strategy accounts for runoff in up to the 1 in 100 year return period.
- The strategy also safeguards against climate change (45%), providing betterment over existing conditions, where the rate and volume of runoff would continue to increase due to climate change.
- Owing to poor rates of infiltration, existing site constraints (RPA's), and lack of available space, it is not possible to implement soakaway drainage, due to the 24-hour half-drain time requirement. Instead, it is proposed that stormwater runoff utilises an attenuated discharge to the adopted combined sewers within Palatine Road, with peak flows limited to 2.7 l/s peak, as agreed with United Utilities. This provides up to 96% betterment compared to the existing site discharge.
- During exceedance events, runoff will overflow from the drainage systems and away from the building into the car parking area. From here, the external works design of the site will ensure that any exceedance flows are stored aboveground within the car parking area and amenity space, before continuing off-site.
- Foul flows generated by the proposed development will be served by a new private network, with discharge to the same combined manhole as surface water flows, within Palatine Road as agreed with United Utilities.
- All on-site proposed drainage will remain private and will be designed in accordance with Building Regulations Part H and CIRIA C753 and will become the responsibility of the building operator.
- As the development will be safe from flooding throughout its lifetime and will actively reduce flood risk to properties within the downstream catchment, it is recommended that the Local Planning Authority confirm they have no objections to the proposed development.

**Key**

- Site Boundary
- Roof Protection Area
- Roof Protection Area to be Removed

**Private Existing Drainage**
