Executive Summary

Appointment	<p>In December 2019 Curtins were instructed by Manchester University NHS Foundation Trust to undertake a Phase 1 Preliminary Risk Assessment for the proposed National Breast Imaging Academy (NBIA) site off Southmoor Road, Wythenshawe, Manchester, M23 9LT. The site is centred on NGR 380710, 388230 and covers an area of approximately 0.22 Ha.</p> <p>Proposals comprise a single storey development with a corridor connecting to the existing Nightingale Centre to the east, with the option to construct an additional storey in the future.</p>
Current Site Status	<p>The site is currently occupied by a car park with areas of soft landscaping along the northern and eastern boundary. External stores associated with the Nightingale Centre are located along the eastern boundary. The site can be accessed from Southmoor Road to the south.</p> <p>The site is bordered by Southmoor Road to the south, commercial and industrial units to the north, the Nightingale Centre to the east and car parking to the west.</p>
Site History	<p>The earliest historical maps show the site was situated within an undeveloped agricultural field with the land surrounding largely undeveloped.</p> <p>From 1910, the wider area was developed to include a sewage works 100m south west with Baguley Sanatorium recorded 230m south. In 1954, Wythenshawe Hospital had been developed 50m south and Wythenshawe Housing estate 250m east.</p> <p>By 1977, a stockpile was recorded on site extending to the east and the west. The sewage works and Baguley Sanatorium were no longer recorded and replaced by the expansion of the hospital.</p> <p>By 2019, the site is occupied by a car park with the current Nightingale Centre developed along the eastern boundary.</p>
Geology	<p>Some Made Ground is anticipated to be present considering the site's history of redevelopment and has been recorded in the surrounding BGS boreholes. Superficial deposits are recorded as Glacial Till (sandy, silty clays) underlain by bedrock noted as the Bollin Mudstone Member (mudstone with siltstone).</p> <p>The recorded BGS boreholes located 232m and 240m north east of the site generally indicate Made Ground to depths of 0.50m to 0.70m bgl, underlain by clay to between 1.80m and 2.10m bgl underlain by siltstone/sandstone bedrock (base not proven).</p>
Hydrogeology	<p>The site is underlain by a Secondary B Aquifer within the bedrock formation, a Secondary Undifferentiated Aquifer associated within superficial deposits and is not located within a Source Protection Zone. There are no groundwater abstractions located within 1km of the site.</p>
Hydrology	<p>The nearest surface water feature is Mill Brook 182m east of the site flowing northwards. No information is available on the GQA Grade of River Quality.</p> <p>There are no recorded surface water abstraction points recorded within 1km. Three pollution incidents have been recorded within 500m of the site within the last 10 years. There are no discharge consents within 500m of the site.</p>
Unexploded Ordnance Risk	<p>The site is situated in Wythenshawe, Manchester, which is identified as a Moderate risk area. A review of the available historic mapping suggests no ruins, bomb strikes or military areas within 1km of the site, therefore the risk from UXO to construction workers is Low.</p>
Initial Ground Contamination Assessment	<p>The risk, from Made Ground, posed to site end-users is considered to be Moderate/Low due to the site's historical use and proximity to industry and the risk posed to groundwater and surface water is Low and Very Low respectively. The risk posed to end-users from ground generating gases is considered to be Moderate/Low.</p>
Recommendations	<p>The following recommendations are made with regards to further works at the site:</p> <ol style="list-style-type: none"> 1. Undertake an intrusive ground investigation; 2. Undertake a GQRA as part of the ground investigation; and 3. Undertake Ground Gas Monitoring. <p>It is further recommended that this work is completed in advance of any development works taking place.</p>

Appendix C Qualitative Risk Assessment Rationale

1.0 Introduction

1.1 Project Background

In December 2019 Curtins were instructed by Manchester University NHS Foundation Trust to undertake a Phase 1 Preliminary Risk Assessment for the proposed National Breast Imaging Academy (NBIA), Wythenshawe Hospital, Southmoor Road, Manchester, M23 9QZ.

1.2 Scope of Services

The Phase 1 is intended to provide an overview of the geo-environmental and geotechnical setting of the site, prior to the proposed development which comprises a single-storey development with a link corridor to the existing Nightingale Centre to the east, with the option to construct an additional storey in the future.

Proposed development layout plans are included in *Appendix A*.

Through this overview, the Phase 1 aims to develop both a working conceptual and ground model for the site, as well as present an initial assessment of any risks that could be presented to the development including its intended end users and the wider environment.

Specifically, the Phase 1 provides an initial assessment of the site regarding:

- a) Potential contamination of the site strata by historical and or current use;
- b) The potential impact on the wider environment by historical and or current use of the site of interest;
- c) The potential impact from surrounding land uses and other environmental factors;
- d) Potential problems associated with geological features such as faulting, mineral extraction, mining and land instability;
- e) The location of apparent sub-surface structures that may affect the proposed redevelopment; and
- f) The location of above-surface features that may affect the proposed redevelopment.

Consideration of detailed flood risk, ecology and archaeological issues are outside of the scope of this report.

2.0 Current Site and Surrounding Area Details

2.1 Site Location and Current Details

Site use, location and description are shown below in *Table 2.1* and *Figure 2.1* on the following page.

Table 2.1 – Site Details

Site Address	Land adjacent to the Nightingale Centre, Wythenshawe Hospital, Southmoor Road, Manchester, M23 9QZ
NGR	380710, 388230
Area of Site	Approximately 0.22 Ha
Current Site Use and Description	<p>The site is currently situated within the wider hospital premises:</p> <ul style="list-style-type: none">• The site is currently occupied by a hardstanding/gravel car park associated the hospital• A grass verge is located along the north and eastern boundary• External stores associated with the Nightingale Centre are located along the eastern boundary.• The site is accessed off Southmoor Road to the south of the site.• The site is typically topographically flat.

Figure 2.1 – Site Location Plan (site boundary shown in pink and 250m and 500m buffers in purple).

2.2 Surrounding Area Details

The following information was also established through undertaking an environmental database search (Envirocheck report (Ref.1) included in *Appendix B*).

Table 2.2 – Surrounding Land Uses

Surrounding Area	N	Grass verge and commercial and industrial units/properties beyond
	E	Nightingale Centre with associated car parking
	S	Southmoor Road and a car park beyond
	W	Car parking and Medicines Evaluation Unit beyond

3.0 Site History

A review of the available historical mapping and other information for the site, as presented within the Envirocheck report (Ref.1), has been undertaken and is presented in *Table 3.0* below.

Table 3.0 – Previous Site and Surrounding Area Uses and Potential Sources of Contamination

Date	Description	Potential Sources of Contamination
1876-1910	<p>The earliest historical mapping shows the site located in an undeveloped agricultural field with a hedgerow crossing from the northwest corner to the southeast.</p> <p>The land surrounding the site is typically undeveloped with agricultural fields.</p> <p>Area becoming developed with public and residential properties in the surrounding area.</p> <p>Four ponds are located within 250m of the site; 70m south, 80m west, 110m south east and 200m south.</p>	<ul style="list-style-type: none"> Limited potential for onsite contamination.
1910 – 1960	<p>Historical mapping dated 1910 onwards shows the site is located in an undeveloped field, with the surrounding area becoming increasingly developed. While the hedgerow crossing the site is no longer shown, a possible drain remains.</p> <p>In 1910, a Sewage Works is recorded 100m south west and Baguley Sanatorium is recorded 230m south (occupying multiple buildings, tennis courts and bowling green).</p> <p>From 1935, the Sewage Works is further developed to include settling tanks, filter and sludge beds and septic tanks. Baguley Sanatorium has undergone further expansion. The ponds 80m west and 110m south east are no longer recorded.</p> <p>In 1954, Wythenshawe Hospital is recorded 50m south and Wythenshawe Housing estate is developed 250m east. The Baguley Sanatorium is extended.</p> <p>In 1960 Baguley Sanatorium becomes Baguley Hospital and the ponds recorded 70m south and 200m south are no longer recorded on the maps.</p>	<ul style="list-style-type: none"> Uncontrolled deposition of Made Ground from construction of the Baguley Sanatorium. Potential infilled ponds surrounding the site. Potential contamination from Sewage Works.
1960 – 1977	<p>A drain is recorded along the southern boundary, but the site remains generally undeveloped.</p> <p>Baguley Hospital is labelled the current Wythenshawe Hospital and the Sewage Works no longer exist (replaced by the extension of the hospital). The hospital now contains a maternity unit, chest disease unit, a tennis court and several car parks.</p> <p>An unspecified pit is recorded 90m north.</p> <p>By 1967, an industrial estate of unspecified works is recorded 250m north.</p>	<ul style="list-style-type: none"> Uncontrolled deposition of Made Ground from the construction of the surrounding hospital buildings and infrastructure.

Date	Description	Potential Sources of Contamination
1977 – 2006	<p>From 1977 a grassed mound/stockpile is recorded on site extending to the east and west. The possible drain crossing the site is no longer shown.</p> <p>Warehouses are recorded immediately north of the site, identified as Roundthorne Industrial estate. The pit 90m north is no longer recorded.</p> <p>Wythenshawe Hospital occupies most of the area to the south and south east of site. The hospital is now located 20m south of the site.</p> <p>Wythenshawe Housing estate Villages to the east of the site continue to become intensely developed.</p> <p>By 1999, the area of Wythenshawe Hospital 50m south of the site has been demolished. The area to the east of the site has been developed to comprise three buildings including a nursery.</p>	<ul style="list-style-type: none"> • Possible infilled drain crossing the site • Uncontrolled deposition of Made Ground from the construction of the surrounding hospital buildings, industrial units and infrastructure. • Infilled pit to the north of the site
2006 – Present	<p>By 2019, the mound/stockpile is no longer recorded and the site is now occupied by a hospital car park with large areas of hardstanding and gravel. The Nightingale Centre has been developed along the eastern boundary.</p> <p>There has been continued expansion of Wythenshawe Hospital to the south and west of the site.</p>	<ul style="list-style-type: none"> • Uncontrolled deposition of Made Ground from demolition/ construction of the carpark on site. • Uncontrolled deposition of Made Ground from the construction of the surrounding hospital buildings and infrastructure. • Infilled depression on site • Fuel spillages associated with use as a car park

Potential sources of onsite contamination are further discussed in *Section 6.0*.

4.0 Geology, Hydrogeology and Hydrology

4.1 Geology and Hydrogeology

A study of the Envirocheck records, British Geological Survey (BGS) 1:50,000 mapping records (Bedrock Edition) and 1:63:000 (Superficial Edition) for Stockport (Sheet 98) (Ref.2 and 3) indicates the following geological and hydrogeological succession underlying the site:

Table 4.1 – Geological/Hydrogeological Succession

Geology	Associated Hydrogeological Classification
Made Ground deposits are not indicated to be present, however some are expected due to historical development onsite.	N/A
Glacial Till ¹	Secondary Undifferentiated Aquifer ³
Bollin Mudstone Member ²	Secondary B Aquifer ⁴

Notes:

1. These comprise a group of sediments laid down by the direct action of glacial ice, usually sandy, silty clay with pebbles, but can contain gravel-rich, or laminated sand layers; varied in colour and consistency.
2. The upper part is a dominantly laminated reddish-brown and greenish-grey mudstone with siltstones. The lower part is a structureless and laminated, dominantly reddish-brown mudstone. Within the lower part of the member, a unit termed the 'Lower Keuper Sandstone' has been recognised in the Stockport area. This unit closely resembles the Tarporley Siltstone Formations of adjacent areas.
3. This is assigned in cases where it has not been possible to attribute either category A or B to a rock type. In most cases, this means that the layer in question has previously been designated as both minor and non-aquifer in different locations due to the variable characteristics of the rock type.
4. Predominantly lower permeability layers which may store and yield limited amounts of groundwater due to localised features such as fissures, thin permeable horizons and weathering. These are generally the water bearing parts of the former non-aquifers.

There are no BGS recorded faults onsite.

There are two BGS recorded boreholes within 250m of the site presented within Table 4.2 below:

Table 4.2 – BGS Borehole Records

Record Reference	Location (NGR)	Details (thickness of strata/details/bottom of strata)
SJ88NW1369	232m northeast (380872, 388441)	0.00m bgl MADE GROUND brown sandy slightly gravelly topsoil with rootlets (0.20m)
		0.20m bgl MADE GROUND stiff reddish brown and bluish grey slightly silty slightly gravelly clay with rootlets (0.30m)
		0.50m bgl Stiff brown slightly gravelly sandy clay with rootlets (0.30m)
		0.80m bgl Firm to stiff brown mottled bluish grey fissured slightly gravelly clay with rootlets (0.60m)
		1.40m bgl Firm reddish brown slightly sandy gravelly CLAY (0.70m)

Record Reference	Location (NGR)	Details (thickness of strata/details/bottom of strata)	
		2.10m bgl	Extremely weak to very weak reddish brown and bluish grey thinly bedded fine grained SANDSTONE (0.20m)
		2.30m bgl	borehole termination
SJ88NW1305	240m northeast (380859, 388461)	0.00m bgl	TOPSOIL dark brown sandy silt with rootlets (0.30m)
		0.30m bgl	MADE GROUND firm brown slightly sandy slightly gravelly clay (0.40m)
		0.70m bgl	Soft to firm brown mottled black and orange slightly sandy slightly gravelly CLAY (1.10m)
		1.80m bgl	Extremely weak reddish brown SILTSTONE with thin laminations of sandstone and mudstone (0.48m)
		2.28m bgl	borehole termination

The site is not situated within a Source Protection Zone (SPZ). There are no groundwater abstractions located within 1km of the site.

4.1.1 Mining

The Coal Authority Interactive Mapping (Ref. 4) confirms the site is not located within a coal mining area therefore the risk to the development from coal mine workings is not considered a risk to the proposed development. There are no known coal outcrops, mine entries or past coal workings within 1km of the site. Based on the foregoing commentary, it is considered there is no risk from previous mining activities.

There are no recorded mineral sites within 1km of the site.

4.1.2 Other Ground Stability Issues

The Envirocheck Report confirms that there is a no hazard to very low risk from the following ground stability hazards on and around the site; collapsible ground, compressible ground, ground dissolution, landslide ground, running sands and shrinking or swelling clay.

4.1.3 Ground Gas

There is potential for ground gas from fifteen historically infilled land (water) within 500m of the site, with two recorded within 100m.

There are no BGS recorded landfills or active Licensed Waste Management Facilities within 1km of the site.

There are no historic landfills within 1km of the site.

The BGS Radon Mapping (Ref.5) confirms the site is situated in a lower probability radon area where <1% of homes are at or above the radon action level. On this basis, radon protection measures are not considered necessary in the construction of new dwellings or extensions.

If the new development incorporates a basement, the advice of a specialist Radon assessor must be obtained.

4.2 Hydrology

The nearest surface water feature is Mill Brook located 182m east of the site and flowing north. No information is available on the GQA Grade of River Quality.

Three pollution incidents have been recorded within 500m of the site in the last 10 years. All incidents are classified as a Category 3 (minor) incident. The nearest entry is recorded 133m north relating to inorganic chemicals (sodium hydroxide) into a freshwater stream/river.

There are no discharge consents recorded within 500m of the site.

5.0 Unexploded Ordnance Risk Assessment

Military activities including those conducted as part of both the First and Second World Wars have resulted in a legacy of unexploded ordnance (UXO) being present within the shallow soils of the UK.

UXO result from various sources including both allied (military training) and German (bombing raids) with a guide figure of approximately 10% of all munitions failing to function as designed.

The likelihood of UXO being encountered on a development site is influenced by several factors including; the proximity to strategic targets, the nature of the development works being undertaken and evidence of local damage in the post-war periods amongst others. To determine the likelihood of UXO being present on a site, a step-wise risk assessment process is followed. This process is outlined within CIRIA C681 Unexploded Ordnance: A Guide for the Construction Industry (Ref.6) with the following commentary considered to represent a Preliminary Risk Assessment intended to guide if and where there is a requirement for a Detailed Risk Assessment.

5.1 Preliminary UXO Assessment

Risk mapping (Ref.7) for UXO's has placed the site in a moderate risk area. Moderate risk areas are those that show a density of bombing hits of 11-50 bombs per 1000 acres and may contain potential WWII targets. The area in and around Manchester generally escaped the worst of Britain's WWII bombing, particularly when compared with other major UK cities, such as Liverpool or London. Furthermore, the peripheries of Manchester were only bombed sporadically, with the major targets in the city consisting of the port, city centre and industry in Stretford.

A review of the available historic mapping shows no ruins on or within 250m of the site. No buildings or areas of development suddenly disappear in post-war mapping.

Based on the forgoing commentary, the likelihood of encountering UXO on site as part of the ground investigation or development works is **Low**, and on this basis no further action is considered to be required.

If unexploded ordnance is discovered, stop immediately, prevent access to the area, and inform the police. If the site boundary or location changes then the UXO risk should be reassessed.

6.0 Conceptual Site Model & Qualitative Risk Assessment

The conceptual site model (CSM) and Qualitative Risk Assessment (QRA) are presented in the table within this section. A diagrammatic CSM is contained within *Appendix A*.

The CSM details the source-pathway-receptor linkages or potential pollutant linkages (PPL) that have been identified for the site. The QRA details the associated level of risk relating to these potential pollutant linkages.

The CSM and QRA concern risk to human health and water environment with additional, more specific risk assessment protocols contained within the main body of this reporting, as detailed in *Section 6.1* below.

The QRA follows the framework outlined within CIRIA C552 (Ref.8) which is summarised within *Appendix C*.

The 'risk rating' within the QRA refers to the risk that the source, pathway, receptor linkage or PPL is complete. Unless specifically stated it does not necessarily refer to an immediate risk and is intended to be used as a tool to assess the necessity for further assessment/investigation.

6.1 Additional Risk Assessments

The following risk assessments, listed below, are not included within the main CSM and QRA but nonetheless can be of critical importance to the onward development of the site:

- The risk presented by Mining is discussed and assessed in *Section 4.1.1*.
- The risk presented by Radon is discussed and assessed in *Section 4.1.3*.
- The risk presented by Unexploded Ordnance is discussed and assessed in *Section 5.0*.

Under current health and safety legislation, employers are required to carry out their own appropriate risk assessments and mitigation to protect themselves and their employees, other human receptors and the environment from potential contamination. Such risks must be adequately mitigated by law, specifically the Construction Design Management (CDM) Regulations, 2015 (Ref.9) which require that potential risks to human health and the environment from construction activities are appropriately identified and all necessary steps taken to eliminate / manage that risk. It has been assumed that any future construction works on site will be undertaken in compliance with these requirements and therefore construction workers involved in the building works at the site have been discounted as a human receptor in the conceptual site model.

Qualitative Risk
Assessment

Generic
Quantitative Risk
Assessment

Detailed
Quantitative Risk
Assessment or;
Remedial Action

- The table below represents the first stage in the land quality risk assessment process: The Qualitative Risk Assessment.
- For a development site to be deemed 'suitable for use', the level of risk needs to be brought down to acceptable levels, i.e. low to very low risk. The purpose of each stage of risk assessment is ultimately to establish, if there is a requirement for additional levels of assessment to be made to have sufficient confidence to support a risk characterisation or management decision, e.g. remedial action.
- In the absence of specific site data, a Generic Quantitative Risk Assessment is invariably recommended.

Conceptual Site Model			Qualitative Risk Assessment			Recommended Actions
Source	Pathway(s)	Receptor(s)	Consequence	Likelihood of Occurrence	Risk Rating	
Significant on-site sources of contamination: <ul style="list-style-type: none"> • Made Ground of unknown composition from uncontrolled deposition of construction/demolition onsite associated with the hospital car parks/access roads. Significant off-site sources of contamination: <ul style="list-style-type: none"> • Potential contamination associated with Made Ground of unknown composition from the construction of the hospital to the south and west, industrial estate to the north and residences to the east • Potential contamination associated with the unknown composition from the demolition of the Sewage Works. • Potential contamination associated with the septic tank previously located east of the site. • Potential contamination from the unknown infill material of the ponds within 500m of the site. 	Direct contact, ingestion, inhalation (dust and vapours)	End-user of site	Medium Chronic health risk	Low Given the previous use on site (stockpiled material and hospital car park), it is considered low likelihood that significant contamination will be encountered within the Made Ground deposits.	Moderate/Low	Generic Quantitative Risk Assessment Recommended as part of the ground investigation.
	Vertical migration through the superficial deposits (soils)	Controlled Waters (groundwater) Secondary B Aquifer (bedrock) Secondary Undifferentiated Aquifer (superficial deposits) No groundwater abstraction points within 1km of the site. Not within a designated Source Protection Zone.	Mild Pollution of sensitive water resources	Low Low permeability Secondary B Aquifer and a lack of water abstractions and SPZs limits the pathways-receptor linkage.	Low	
	Horizontal migration over and through the superficial deposits (soils)	Controlled Waters (surface water) Nearest surface water course is Mill Brook located 182m east of the site. No surface water abstraction points within 1km.	Mild Pollution of low sensitivity water resources	Unlikely Considering the distance from the site to the nearest surface water receptor, this pathway is considered unlikely.	Very Low	No further action required.
Significant sources of ground gas: <ul style="list-style-type: none"> • Potential ground gas generation from Made Ground deposits containing organic/ putrescible content and infilled ponds to the southeast and southwest. 	Vertical and horizontal migration through existing service corridors and the underlying superficial deposits	End-user of site	Medium Human health risk	Low Considering the unlikelihood of extensive organically rich Made Ground deposits at the site, the potential for ground gas generation is considered Low.	Moderate/Low	Generic Quantitative Risk Assessment Recommended as part of the ground investigation.

7.0 Conclusion and Recommendations

The qualitative risk assessment (QRA) determined a varied level of level of risk associated with the proposed development.

The QRA concluded by recommending that generic quantitative risk assessments (GQRA) were conducted to confirm the assessment of risk ascribed to each of the respective potential pollutant linkages (PPLs). It is recommended that the GQRA is conducted as part of a ground investigation in support of the engineering design of the proposed development.

In summary, the following recommendations are made:

- Undertake an intrusive ground investigation;
- Undertake a GQRA as part of the ground investigation; and
- Undertake ground gas monitoring.

It is further recommended that the site investigation works are completed in advance of any development works taking place.

7.1 Contaminants of Concern

Potential contaminants of concern associated with the sources identified within the Conceptual Site Model in *Section 6.0* of this reporting include but are not limited to: broad range aliphatic and aromatic hydrocarbons present within any fuel oils; polycyclic aromatic hydrocarbons (PAHs); inorganic compounds including heavy metals; and asbestos present in discarded building materials.

Potential contaminants associated with the airborne dust/particulates include but are not limited to: polycyclic aromatic hydrocarbons and inorganic compounds including toxic metals that are also accounted for by potential onsite contaminants of concern.

7.2 Other Considerations

The requirement for additional surveys, e.g. arboricultural and ecological surveys, should be confirmed through advice from a suitably qualified and experienced professional.

- Envirocheck Report (Ref. 227986816_1_1)

Envirocheck[®] Report:

Datasheet

Order Details:

Order Number:

227986816_1_1

Customer Reference:

072094

National Grid Reference:

380710, 388230

Slice:

A

Site Area (Ha):

0.22

Search Buffer (m):

1000

Site Details:

National Breast Imaging Academy
Wythenshawe Hospital
Southmoor Road
Manchester
M23 9QZ

Client Details:

Miss S Hyde
Curtins Consulting Ltd
Merchant Exchange
17-19 Whitworth Street West
Manchester
M1 5WG

Useful Contacts	54

Introduction

The Environment Act 1995 has made site sensitivity a key issue, as the legislation pays as much attention to the pathways by which contamination could spread, and to the vulnerable targets of contamination, as it does the potential sources of contamination. For this reason, Landmark's Site Sensitivity maps and Datasheet(s) place great emphasis on statutory data provided by the Environment Agency/Natural Resources Wales and the Scottish Environment Protection Agency; it also incorporates data from Natural England (and the Scottish and Welsh equivalents) and Local Authorities; and highlights hydrogeological features required by environmental and geotechnical consultants. It does not include any information concerning past uses of land. The datasheet is produced by querying the Landmark database to a distance defined by the client from a site boundary provided by the client. In this datasheet the National Grid References (NGRs) are rounded to the nearest 10m in accordance with Landmark's agreements with a number of Data Suppliers.

Geology 1:50,000 Maps

This report contains geological map extracts taken from the BGS Digital Geological map of Great Britain at 1:50,000 scale and is designed for users carrying out preliminary site assessments who require geological maps for the area around the site. This mapping may be more up to date than previously published paper maps.

The various geological layers - artificial and landslip deposits, superficial geology and solid (bedrock) geology are displayed in separate maps, but superimposed on the final 'Combined Surface Geology' map. All map legends feature on this page. Not all layers have complete nationwide coverage, so availability of data for relevant map sheets is indicated below.

Geology 1:50,000 Maps Coverage

Artificial Ground and Landslip

Artificial ground is a term used by BGS for those areas where the ground surface has been significantly modified by human activity. Information about previously developed ground is especially important, as it is often associated with potentially contaminated material, unpredictable engineering conditions and unstable ground.

Artificial ground includes:

- Made ground - man-made deposits such as embankments and spoil heaps on the natural ground surface.
- Worked ground - areas where the ground has been cut away such as quarries and road cuttings.
- Infilled ground - areas where the ground has been cut away then wholly or partially backfilled.
- Landscaped ground - areas where the surface has been reshaped.
- Disturbed ground - areas of ill-defined shallow or near surface mineral workings where it is impracticable to map made and worked ground separately.

Mass movement (landslip) deposits on BGS geological maps are primarily superficial deposits that have moved down slope under gravity to form landslips. These affect bedrock, other superficial deposits and artificial ground. The dataset also includes foundered strata, where the ground has collapsed due to subsidence.

Superficial Geology

Superficial Deposits are the youngest geological deposits formed during the most recent period of geological time, the Quaternary, which extends back about 1.8 million years from the present.

They rest on older deposits or rocks referred to as Bedrock. This dataset contains Superficial deposits that are of natural origin and 'in place'. Other superficial strata may be held in the Mass Movement dataset where they have been moved, or in the Artificial Ground dataset where they are of man-made origin.

Most of these Superficial deposits are unconsolidated sediments such as gravel, sand, silt and clay, and onshore they form relatively thin, often discontinuous patches or larger spreads.

Bedrock and Faults

Bedrock geology is a term used for the main mass of rocks forming the Earth and are present everywhere, whether exposed at the surface in outcrops or concealed beneath superficial deposits or water.

The bedrock has formed over vast lengths of geological time ranging from ancient and highly altered rocks of the Proterozoic, some 2500 million years ago, or older, up to the relatively young Pliocene, 1.8 million years ago.

The bedrock geology includes many lithologies, often classified into three types based on origin: igneous, metamorphic and sedimentary.

The BGS Faults and Rock Segments dataset includes geological faults (e.g. normal, thrust), and thin beds mapped as lines (e.g. coal seam, gypsum bed). Some of these are linked to other particular 1:50,000 Geology datasets, for example, coal seams are part of the bedrock sequence, most faults and mineral veins primarily affect the bedrock but cut across the strata and post date its deposition.

Combined Surface Geology

The Combined Surface Geology map combines all the previous maps into one combined geological overview of your site.

Please consult the legends to the previous maps to interpret the Combined "Surface Geology" map.

Additional Information

More information on 1:50,000 Geological mapping and explanations of rock classifications can be found on the BGS website. Using the LEX Codes in this report, further descriptions of rock types can be obtained by interrogating the 'BGS Lexicon of Named Rock Units'. This database can be accessed by following the 'Information and Data' link on the BGS website.

Lancashire And Furness
Published 1848
Source map scale - 1:10,560

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840's. In 1854 the 1:2,500 scale was adopted for mapping urban areas; these maps were used to update the 1:10,560 maps. The published date given therefore is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas. In the late 1940's, a Provisional Edition was produced, which updated the 1:10,560 mapping from a number of sources. The maps appear unfinished - with all military camps and other strategic sites removed. These maps were initially overprinted with the National Grid. In 1970, the first 1:10,000 maps were produced using the Transverse Mercator Projection. The revision process continued until recently, with new editions appearing every 10 years or so for urban areas.

They were produced by the Russians for the benefit of navigation, as well as strategic military sites and transport hubs, for use if they were to have invaded the U.K. The detailed information provided indicates that the areas were surveyed using land-based personnel, on the ground, in the cities that are mapped.

10k Raster Mapping

Published 1999

Source map scale - 1:10,000

The historical maps shown were produced from the Ordnance Survey's 1:10,000 colour raster mapping. These maps are derived from Landplan which replaced the old 1:10,000 maps originally published in 1970. The data is highly detailed showing buildings, fences and field boundaries as well as all roads, tracks and paths. Road names are also included together with the relevant road number and classification. Boundary information depiction includes county, unitary authority, district, civil parish and constituency.

VectorMap Local

Published 2019

Source map scale - 1:10,000

VectorMap Local (Raster) is Ordnance Survey's highest detailed 'backdrop' mapping product. These maps are produced from OS's VectorMap Local, a simple vector dataset at a nominal scale of 1:10,000, covering the whole of Great Britain, that has been designed for creating graphical mapping. OS VectorMap Local is derived from large-scale information surveyed at 1:1250 scale (covering major towns and cities), 1:2500 scale (smaller towns, villages and developed rural areas), and 1:10 000 scale (mountain, moorland and river estuary areas).

Cheshire

Published 1876 - 1877

Source map scale - 1:2,500

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840's. In 1854 the 1:2,500 scale was adopted for mapping urban areas and by 1896 it covered the whole of what were considered to be the cultivated parts of Great Britain. The published date given below is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas.

Supply of Unpublished Survey Information

Published 1975

Source map scale - 1:1,250

SUSI maps (Supply of Unpublished Survey Information) were produced between 1972 and 1977, mainly for internal use at Ordnance Survey. These were more of a 'work-in-progress' plan as they showed updates of individual areas on a map. These maps were unpublished, and they do not represent a single moment in time. They were produced at both 1:2,500 and 1:1,250 scales.

Appendix C Qualitative Risk Assessment Rationale

The site-specific risk assessment, presented in this report, follows the principle of establishing whether there is a viable linkage between a contaminant source to a potential receptor, via an exposure pathway.

The risk assessment corresponds with the total site area and incorporates both descriptive (qualitative) and, where available, numerical (quantitative) lines of evidence.

Risk assessment is the process of collating known information on a hazard or set of hazards to estimate actual or potential risk to receptors. The receptor may be humans, a water resource, a sensitive local ecosystem or future construction materials. Receptors can be connected to the source by one or several exposure pathways such as direct contact for example. Risks are generally managed by isolating the receptor or intercepting the exposure pathway or by isolating or removing the hazard.

Without the three essential components of a source, pathway and receptor there can be no risk. Therefore, the presence of contaminant source on a site does not necessarily mean there is a risk.

The risk assessment considers the likelihood of an event taking place (accounting for the presence of the source and receptor and the viability of the exposure pathway) in conjunction with the severity of the potential consequence (accounting for the potential severity of the hazard and the sensitivity of the receptor).

In the risk assessment, the consequence of the hazard has been classified as severe or medium or mild or minor and the probability (likelihood) of the circumstances occurring classified as high likelihood or likely or low likelihood or unlikely.

The consequences and probabilities are subsequently cross-correlated to give a qualitative estimation of the risk using Department of the Environment risk classifications as detailed in the table below and as referenced in CIRIA C552.

		Consequence			
		Severe	Medium	Mild	Minor
Probability (Likelihood)	High Likelihood	Very High Risk	High Risk	Moderate Risk	Moderate/Low Risk
	Likely	High Risk	Moderate Risk	Moderate/Low Risk	Low Risk
	Low Likelihood	Moderate Risk	Moderate/Low Risk	Low Risk	Very Low Risk
	Unlikely	Moderate/Low Risk	Low Risk	Very Low Risk	Very Low Risk

Phase 1 Preliminary Risk Assessment

In accordance with DoE guidance, the following categorisation of **consequence** has been developed.

Classification	Definition	Examples
Severe	Short-term (acute) risk to human health likely to result in "significant harm" as defined by the Environment Protection Act 1990, Part IIA. Short-term risk of pollution of sensitive water resource. Catastrophic damage to buildings/property. A short-term risk to an ecosystem or organisation forming part of such ecosystem.	<p>High concentrations of cyanide on the surface of an informal recreation area.</p> <p>Major spillage of contaminants from site into controlled water.</p> <p>Explosion, causing building collapse (can also equate to a short-term human health risk if buildings are occupied).</p>
Medium	Chronic damage to Human Health. Pollution of sensitive water resources. A significant change in an ecosystem or organism forming part of such ecosystem.	<p>Concentration of a contaminant from site exceeds the generic or site-specific assessment criteria.</p> <p>Leaching of contaminants from a site to a Principal or Secondary A aquifer.</p> <p>Death of a species within a designated nature reserve.</p> <p>Lesser toxic and asphyxiate effects</p>
Mild	Pollution of non-sensitive water resources. Significant damage to crops, buildings, structures and services. Damage to sensitive buildings/structures/services or the environment.	<p>Pollution of non-classified groundwater (inc. Secondary B aquifers).</p> <p>Damage to building rendering it unsafe to occupy (e.g. foundation damage resulting in instability).</p>
Minor	Harm, although not necessarily significant harm, which may result in a financial loss or expenditure to resolve. Non-permanent health effects to human health (easily prevented by means such as personal protective clothing, etc). Easily repairable effects of damage to buildings, structures and services.	<p>The presence of contaminants at such concentrations that protective equipment is required during site works.</p> <p>The loss of plants in a landscaping scheme.</p> <p>Discoloration of concrete.</p>

Phase 1 Preliminary Risk Assessment

In accordance with DoE guidance, the following categorisation of **probability** has been developed.

Classification	Definition
High Likelihood	There is a pollution linkage and an event that either appears very likely in the short term and almost inevitable over the long term or there is evidence at the receptor of harm or pollution.
Likely	There is a pollution linkage and all the elements are present and in the right place, which means that it is probable that an event will occur. Circumstances are such that an event is not inevitable, but possible in the short term and likely over the long term.
Low Likelihood	There is a pollution linkage and circumstances are possible under which an event could occur. However, it is by no means certain that even over a longer period such event would take place and is less likely in the shorter term.
Unlikely	There is a pollution linkage, but circumstances are such that it is improbable that an event would occur even in the very long term.

In accordance with DoE guidance, the following categorisation of **risk** has been developed.

Classification	Definition
Very High Risk	There is a <i>high probability</i> that <i>severe harm</i> could arise to a designated receptor from an identified hazard at the site without appropriate further action.
High Risk	<i>Harm is likely to arise</i> to a designated receptor from an identified hazard at the site without appropriate further action.
Moderate Risk	<i>It is possible</i> that without appropriate further action <i>harm could arise</i> to a designated receptor. It is relatively <i>unlikely</i> that any such harm would be <i>severe</i> , and if any harm were to occur it is <i>more likely</i> that such harm would be <i>relatively mild</i> .
Low Risk	<i>It is possible</i> that <i>harm could arise</i> to a designated receptor from an identified hazard. It is <i>likely</i> that, at worst, if any harm was realised any effects would be <i>mild</i> .
Very Low Risk	The presence of an identified hazard does not give rise to the potential to cause harm to a designated receptor.

The term 'risk' in this instance refers to the risk that the source, pathway, receptor linkage for a given source of contamination is complete. It does not refer to immediate risk to individuals or features present on the site from potential contaminants and is intended to be used as a tool to assess the necessity of further investigation.

Our Locations

Birmingham

2 The Wharf
Bridge Street
Birmingham
B1 2JS
T. 0121 643 4694
