

Proposed tree work: (see previous consent – Application No: 117788/TPO/2017)

Note: The following proposals are, after numerous discussions, a conclusion for the best way forward to manage the three trees considering the historic and recent root abuse that could cause the premature death of all three trees. Removing the poorest specimen, (Lime T2) and replacing it with a Small Leafed Lime or similar should ensure some continuity of tree cover should the other two trees die in the next few years.

T1 Lime – Remove rogue stem, remove major dead wood and crown reduce by 1.5 to 2.5m (more heavily on the house side).

T2 Multi-stemmed Lime (see above) – Fell, grind the main root ball, with minimum disturbance to the chestnut (T3) roots, and replace with Whitebeam

T3 Chestnut – Reduce one large limb overhanging the neighbouring property by the removal of selected larger sections with the aim to improve the aesthetics of the distorted crown with leaving a wound on the main stem. Reduce the remainder of the crown by 2 to 3m, mainly on the house side. Remove major dead wood.
