

Old Market Street

Site Specific Dust Management Plan

Site Manager to ensure COSHH assessments are carried out on any materials likely to produce dust or fumes.

Site Manager to ensure relevant RAM's have been issued and are acceptable prior to any work commencing.

Site Manager to ensure the correct PPE is worn (as per associated risk assessment).

Auger piling to be implemented to reduce the occurrence of dust and airborne particles.

If the ground is particularly dry during excavations, it must be dampened down prior to removal from site to minimise the air particles.

A road sweeper must be regularly employed to reduce the amount of mud and dust created on the road during access and egress.

Block splitter to be used instead of cut-off saw where possible.

Drill bits must be sharp.

Water to be used to dampen down the dust if cut-off saw has to be used.

Avoid sweeping, vacuum with hepa filter where possible or, if unavoidable use water to dampen prior to sweeping.
