Project Title: St. Michaels, Manchester **Project Ref: 2986**

Date: 31/08/2021 **Report Ref: 02**

INTRODUCTION

The application site is bounded by Jacksons Row, Bootle Street and Southmill Street.

The proposals include the demolition of the existing buildings on the site, with the exception of part of the old police station building (with the entrance off Southmill Street), which will be converted into office accommodation. The Sir Ralph Abercromby Public house will remain largely unaltered. The development of the site is to deliver a mixed used development which will be divided into two blocks as follows:

Phase 2

- Offices
- Retail/Restaurant/bar

ENERGY STRATEGY & SUSTAINABLE DESIGN APPROACH

The energy strategy is formulated around a collective approach to implement a sustainable development strategy which incorporates environmentally sound methods of construction, a passive design approach to reduce energy demand, and highly efficient energy supply and distribution. It is intended to highlight within this review the systems which provide a reduced energy use strategy in order to serve the relevant elements of the Building Services for the development.

As such, the following passive design techniques and technologies are proposed for the development;

- Building fabric performance (u-values) beyond minimum standards and best practice, reducing heat loss and gain
- Daylight linked lighting and controls to minimise lighting energy usage
- Reducing embodied carbon impact through material selection and construction techniques
- Demand controlled ventilation; reducing energy usage associated with ventilation, heating and cooling systems.
- Air Source Heat Pumps providing heating and cooling with heat recovery between the two systems. Variable volume systems with advanced control will minimise operational energy use.
- Heat Recovery Ventilation to all areas, with variable volume control based on necessity.

The energy strategy for the redevelopment of the existing building on Southmill street aims to improve energy efficiency as far is reasonably practical without prejudicing the character of the building or increasing the risk of long-term deterioration of the building fabric or fittings.

To underline the approach to energy and carbon, the office development is seeking a NABERS 5 star rating. NABERS is based on real life energy consumption and encourages the landlord and tenant to operate efficiently, monitor and report energy consumption.

The commercial office development is targeting a BREEAM assessment result of 'Outstanding' and the sustainable approach to the design and arrangement of the systems will aspire to meet these requirements. The development will utilise heat recovery air source heat pumps for heating and cooling and be constructed to maximise passive methods to condition the buildings thermal and visual environment. The location of the proposed development is highly sustainable in terms of its links with public transport, and the use of the land incorporating a hotel and bar/dining facility reinforces the desire to create a sustainable development in the wider context, reducing transport emissions which provides benefits to the local culture and economy. The reuse of the existing site will also ensure embodied carbon will be minimised during the construction.

In addition to this, the office development will be developed with principles of WELL. This combined approach aims to address energy, carbon and wellbeing.

KEY OBJECTIVES

Manchester Core Strategy Document

The Manchester Core Strategy document 2012 is a key document in Manchester Local Development Framework and sets planning policies. With respect to energy and CO2 emissions, the notable subjects that are expected to be covered by a large multiuse development are;

Policy EC 1 - Employment and Economic Growth in Manchester

Development proposals should have regard to Climate change resilience demonstrating how CO2 emissions will be minimised with an aim of zero carbon emissions, through;

- Energy efficiency
- Renewable energy
- Decentralised energy infrastructure;

Policy EN 5 - Strategic Areas for low and zero carbon decentralised energy infrastructure

Within Manchester it is expected that new developments are expected to take place in the context of more detailed proposals for decentralised low and zero carbon energy infrastructure in the form of energy proposals plans. The Council will work with all relevant stakeholders, which may include developers, private sector partners, utilities companies, neighbouring authorities and other public sector bodies, as appropriate, to bring forward such plans.

Web: www.zerum.co.uk

Where investment or development is being undertaken into or adjacent to a public building/asset or district heating network, full consideration will be given to the potential role that these can have in providing an anchor load within a decentralised energy network or in creating opportunities for CO_2 reduction funded by contributions

Policy EN 6 - Target Framework for CO_2 reductions from low or zero carbon energy supplies

Applications for residential development of 10 or more units and all other development over 1,000 m_2 will be expected as a minimum to meet the target shown below unless this can be shown not to be viable. This should be demonstrated through an energy statement, submitted as part of the Design and Access Statement. Such a statement will be expected to set out the projected regulated energy demand and associated CO_2 emissions for all phases of the development.

- Target 1 Network development areas: Locations where the proximity of new and existing buildings, the mix of uses and density of development provide the right conditions to support district heating (and cooling).
- Target 2 Electricity intense areas: Locations where the predominant building type has an all-electric fit-out such as retail units and leisure complexes.
- Target 3 Micro-generation areas: Locations where lower densities and a fragmented mix of uses tend to mean that only building scale solutions are practical.

Target area 1 applies to this scheme, as the development has at least three of the following - commercial offices, hotel, residential, apartments, public building, supermarket, or it is adjacent to an existing district heat network. If connection to an existing heat network, or installation of a new heat network is not considered feasible or viable then a development would be expected to follow Target Area 3."

For the Domestic aspect of the proposed scheme, the requirements of Code Level 4 are more onerous than the targets stated above.

For Non Domestic buildings, the requirement of a 15% reduction in carbon set out above is the most onerous target, unless, a specific BREEAM rating is stipulated by the planners of desired by the developers.

Policy EN 7- Energy Infrastructure opportunities

There will be a general presumption in favour of low and zero carbon decentralised energy schemes, subject to the following considerations:

That any new generating plant capable of producing heat and cooling as well as electricity should be located in a way that facilitates future connection to a local distributed energy system. That any energy centre, including generating plant, standby/boiler plant and substations, will be located and designed to a high quality so as to integrate with and contribute to the townscape.

Summary

Non Domestic Target
15% reduction in emissions from Part L 2010
BREEAM target not stipulated.

Domestic Target
Code Level 4, but has been removed. Instead, it is expected that the target of 25% reduction over Part L 2010 or 19% reduction over Part L 2013 will be required.

Technologies and Systems
Of the renewable energy and low carbon technologies available, the following have been considered for inclusion on this development;

1. CHP (combined heat and power)
2. Air source heat pumps
3. Photovoltaic Cells
4. Connection to the Manchester district heating network
5. Passive measures for thermal performance in the construction of the building.

When reviewing these systems against the lengthy payback periods, the prohibitive installation and maintenance costs, and the possible limited renewable energy usage provided, Air Source Heat Pump technology and passive design measures proved the most suitable for this project.

Sustainable Design

Sustainable design is the practice of designing physical objects, particularly in the built environment, to encompass with the principles of economic, social, and environmental sustainability. Defined as meeting the needs of the present without compromising those of the future, it ranges from the design of small objects for everyday use, through to the designing of buildings, landscapes and cities. It is an essential tool within the fields of architecture, urban design and planning engineering, graphic design, industrial design, interior design and fashion design.

- The aim of sustainable design within Building services is to construct buildings and services in a way that reduces the use of non-renewable resources and minimises the impact on the environment fossil fuel emissions can have.

- Targeting the passive design features of a building can reduce the reliance on energy resources for building heating and cooling initially as greater air tightness results in less temperature fluctuations within a development.

- Alternatively, where energy for building services must be consumed, renewable energy can be used. Described as the energy flows derived from natural sources, these sources are continuously at work in within the environment and are theoretically not depleted when used.

- A New Thermal Envelope for the development would be sought to be designed and constructed to go beyond the minimum requirements laid down in the current L2A Building

Regulations 2013, both in terms of Fabric U-Values and Air Permeability.

- Natural Daylighting and artificial light dimming would be maximised to reduce artificial lighting load. The use of low energy electric lighting would also be sought to be implemented in excess of that currently required to comply with Building Regulations.

The design approach, in respect to minimising carbon emissions from the development, aligns with the best practise guidelines adopted by the Local Planning Authority in their Core Strategy policies. This policy states that Lean, Clean and Green energy savings should be considered sequentially.

The lean savings are measures to improve the baseline energy performance and would typically mean improvements to the thermal conductivity of the fabric and glazing, high efficiency pumps, lighting, alongside lighting control systems.

The clean savings are measures that reduce carbon dioxide emissions when compared to the standard design approach, but rely on an element of non-renewable energy consumption. The technologies that could be considered here would be;

- VRF (variable refrigerant flow) systems;
- WR2 (water source variable refrigerant flow) systems; and
- Combined Heat and Power;

Both the VRF and WR2 systems are refrigerant based comfort cooling systems which use different mediums, ie; VRF uses air and WR2 uses water as the means of heat absorption and rejection.

Sustainable Design	**Applied to Development**
Improved Fabric U-values over and above 2013 Part L2a regulations	Yes – passive measure
Improved air tightness over and above the 2013 Part L2a regulations	Yes – passive measure
VRF heat recovery comfort cooling systems	Yes – low carbon technology
Heat recovery ventilation systems	Yes – passive measures
LED lighting throughout	Yes – low carbon technology

PHASE 2

Offices MEP Strategy

- Air source heat pumps with heat recovery provide simultaneous heating and cooling via LTHW and CHW systems, serving both ventilation plant and office fan coil units.
- LED low energy lighting installed throughout
- Heat recovery ventilation systems installed to all internal office areas
- Variable air volume office ventilation systems, modulating based on CO2 level control.
- Daylight linking to all office lighting installation to locally switch off perimeter lighting rows during daylight hours.
- Lighting control systems installed to local zones to turn off groups of fittings via presence or absence detection systems.
- Local electric hot water supplies to toilets, showers and kitchenettes.
- Inverter driven pumps and fans installed throughout.

Manchester Core Strategy Policy EN6 states that applications for developments over 1000m^2 will be expected as a minimum to meet the following target for Energy Intense Buildings: + 15% increase on Part L 2010.

Between the Part L 2010 and Part L 2013 Building Regulations, the target emission rates were improved by 9% for non-domestic buildings.

With this, these technologies will provide the requirement to achieve the 9% improvement in carbon emissions.

The reduction in regulated carbon will be demonstrated using approved compliance simulation software – using a dynamic simulation modelling approach. A BRUKL report (Building Regulation UK Part L) which calculates Part L (fuel and energy conservation) of the Building Regulations 2013 measured against maximum target carbon dioxide emissions for buildings will be included.

Note that alongside this assessment, an operational energy assessment is being undertaken – using the NABERS approach will realises whole building operational carbon.

Retail/Restaurants/Bar MEP Strategy

Whilst not included in the base build, the following is anticipated from the fitout of the retail units.

1 EXECUTIVE SUMMARY

The proposed development St Michael's is located within Manchester city centre. As such the policies detailed in the Manchester Core Strategy must be adhered to. This report will directly address policies EN4, EN6 and EN8 in respect of Phase3 which includes the hotel, restaurant and office space.

The methodology for this report is to take a 'fabric first' approach as set out in Manchester City Councils Core Strategy, making improvements to the envelope first, reviewing the results due to these fabric improvements and then reviewing suitable technologies to enhance this design philosophy where feasible. As the building notice for this development was submitted before June 15th, 2022, and works will commence on-site before June 15th, 2023, Transitional Arrangements apply, therefore the results in this report will be based on Building Regulations 2012. The proposed fabric specification is described in Table 1 below.

Table 1 Building Fabric Specification

Proposed fabric values are lower than the limiting/notional values and accredited construction details have been used throughout to improve the Y-value. This is key to the fabric first approach which aims to reduce annual CO_2 production in line with the policies of the Manchester Core Strategy.

Regarding the systems used, the development will utilise low carbon Air Source Heat Pump technology to provide both heating and cooling, hot water for non-domestic areas will also be provided by ASHP technology. Domestic hot water will be provided electric immersion cylinders and mechanical ventilation with heat recovery (MVHR) will be used for ventilation.

A breakdown of systems is provided in Table 2 below.

Table 2 Systems by General Area Type

General Area	Heating/Cooling	Ventilation	Hot Water

Non-Domestic Circulation	Panel Heater	N/A	N/A

Utilising an all-electric strategy combined with the Fabric Energy Efficiency improvements will allow the development to achieve the required CO_2 reduction dictated by the Manchester Core Strategy. Currently the portion of renewable energy supplying the national grid is circa 48% therefore as the grid becomes greener so will developments that primarily use grid electricity.

In addition to efficient systems, consideration has been given to the reduction of mains potable water usage through efficient water fixtures. This is further detailed in section 4.5 however potable water demand is to be reduced to <16 litres/person/day as per the requirement within Building Regulations.

There is an emphasis on fully utilising electric systems in this recommendation owing to the implementation of Part L 2021, which incorporates major changes to the Fuel Carbon Factors for each fuel type and effectively brings grid electricity in line with gas. Whilst Transitional Arrangements apply to this development and final lodgement will ultimately be done on 2012 Building Regulations; this Energy Strategy is designed with the carbon factors of 2021 Building Regulations in mind. Thereby addressing the carbon reduction requirements of the Manchester Core Strategy more accurately and better representing the developments carbon efficiency.

This is further discussed in Section 2.5.1 of this report, the primary benefit of the decarbonising of grid electricity is that it makes all-electric schemes far more efficient in terms of CO_2 reduction and opens up the possibility of achieving zero carbon in the future as the portion of renewable energy being added to the grid increases. An all-electric strategy has therefore been pursued to take advantage of this benefit.

An all-electric system has been pursued over a wet system as the use of a wet heating system, connected to the district heating source, would require additional plant space at ground floor level to incorporate plate heat exchangers, large buffer vessels, pumps, pressurisation units. This would lose key space at ground floor level as well as expand the amount of plant for the development to maintain.

For the whole development, the following results have been obtained, based on an area weighted average calculation to produce a single result for the full building. Please note that the SAP10 calculation software has not been fully released at this stage, therefore these results are subject to change as the final version of the software becomes available:

Table 3 Building Regulations Part L 2012 Results

Target Emission Rate vs Dwelling Emission Rate	
Combined Target Carbon Dioxide Emission Rate (TER)	26.66 $kgCO_2/m^2.yr$
Combined Dwelling Carbon Dioxide Emission Rate (BER)	25.12 $kgCO_2/m^2.yr$
% Reduction	5.79%
Target Fabric Energy Efficiency vs Dwelling Fabric Energy Efficiency	
Combined Target Fabric Energy Efficiency (TFEE)	39.15 kWh/m^2
Combined Dwelling Fabric Energy Efficiency (DFEE)	34.85 kWh/m^2
% Reduction	10.98%

Table 4 Estimated Building Regulations Part L 2021 Results

Target Emission Rate vs Dwelling Emission Rate	
Combined Target Carbon Dioxide Emission Rate (TER)	8.67 $kgCO_2/m^2.yr$
Combined Dwelling Carbon Dioxide Emission Rate (BER)	6.74 $kgCO_2/m^2.yr$
% Reduction	22.28%

A 22.28% overall reduction in CO_2 emissions can be observed. The Manchester Core Strategy requires a 15% improvement over Part L 2010 Building Regulations. These regulations have been superseded by 2013 and 2021 Building Regulations which collectively are a 37% betterment over 2010 Building Regulations by default. Therefore, by achieving a CO_2 reduction of 22.28%, this equates to a 59.28% improvement over 2010 Building Regulations and offers full compliance with the requirements of the Manchester Core Strategy.

Figure's 1 & 2 below summarises the carbon performance at each stage of the Energy Hierarchy.

2 INTRODUCTION

2.1 PURPOSE

NOVO Integration Ltd has been appointed as Energy Consultants to produce an Energy and Environmental Standards Statement for the St Michael's development, Manchester.

This is to support the scheme design process, demonstrate Building Regulations Part L compliance and to achieve the applicable planning polices set out in the Manchester Core Strategy.

Figure 3: St Michael's Manchester

This report will outline the following:

1. Assess Phase 3 of the proposed development site's estimated CO_2 emissions, it will look into the feasibility of Low Zero Carbon technologies, examining the following aspects relative to LZC/renewable technologies:

    - Energy generated by Renewable/Low Zero Carbon Technologies (LZC)
    - Feasibility assessment for each Renewable/Low Zero Carbon Technologies (LZC)
    - Local Planning Requirements

2. The proposed building fabric and Low Zero Carbon (LZC) design strategy and analysis calculations, with respect to the Standard Assessment Procedure (SAP) and Simplified Building Energy Model (SBEM). Demonstration of how the design is compliant against Part L1/2A Buildings Regulations.

2.2 BACKGROUND POLICY DOCUMENTS

The following statements and regulatory guidelines form the policy background to this energy strategy:

- The Kyoto Protocol at the United Nations.
- Framework Convention on Climate Change as negotiated in December 1997 has come into effect on 16 February 2005 following the ratification of the agreement by Russia on 18 November 2004. The Burden Sharing Agreement of the EU mandates a 12.5% reduction in greenhouse gas emissions for the UK by 2008 - 12.
- The Department of Transport and Industry White Paper, titled "Our Energy Future - Creating a Low Carbon Economy", spells out a target for 10% of electricity to be from renewable sources nationally by 2010 and twice this by 2020.
- National Policy Objectives in regard to renewable energy Planning Policy Statement 22: Renewable energy guidance for local governing bodies concerning implementation of renewable energy technologies through appropriate planning.
- The United Kingdom has made commitments that extend beyond this requirement. National Targets are for a reduction to 20% below 1990 CO_2 levels by 2010 and a 60% reduction by 2050.
- Integrating renewable energy into new developments: Toolkit for planners, developers and consultants, September 2004.
- The Building Regulations 2013 - Approved Document L - Conservation of Fuel and Power in new buildings other than dwellings.

- National Planning Policy Framework (July 2021)
  The National Planning Policy Framework is a key part of our reforms to make the planning system less complex and more accessible, to protect the environment and to promote sustainable growth. In particular point A of paragraph 16 which states the following:

  Plans should:

  a) be prepared with the objective of contributing to the achievement of sustainable development.

  b) be prepared positively, in a way that is aspirational but deliverable

  c) be shaped by early, proportionate, and effective engagement between plan makers and communities, local organisations, businesses, infrastructure providers and operators and statutory consultees

  d) contain policies that are clearly written and unambiguous, so it is evident how a decision maker should react to development proposals

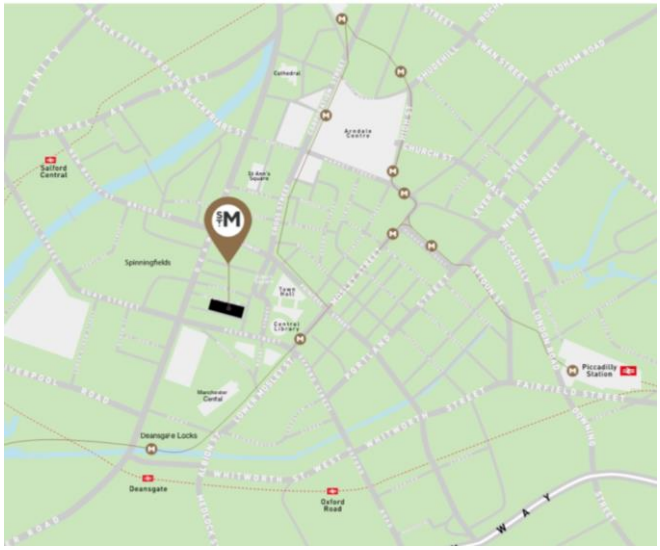
  e) be accessible through the use of digital tools to assist public involvement and policy presentation; and

f) *serve a clear purpose, avoiding unnecessary duplication of policies that apply to a particular area (including policies in this Framework, where relevant).*

Another key point of the NPPF is paragraph 8, point C which states the following:

Achieving sustainable development means that the planning system has three overarching objectives, which are interdependent and need to be pursued in mutually supportive ways (so that opportunities can be taken to secure net gains across each of the different objectives):

a) *an economic objective – to help build a strong, responsive and competitive economy, by ensuring that sufficient land of the right types is available in the right places and at the right time to support growth, innovation and improved productivity; and by identifying and coordinating the provision of infrastructure;*



b) *a social objective – to support strong, vibrant and healthy communities, by ensuring that a sufficient number and range of homes can be provided to meet the needs of present and future generations; and by fostering a well-designed and safe built environment, with accessible services and open spaces that reflect current and future needs and support communities' health, social and cultural well-being; and*

c) *an environmental objective – to contribute to protecting and enhancing our natural, built and historic environment; including making effective use of land, helping to improve biodiversity, using natural resources prudently, minimising waste and pollution, and mitigating and adapting to climate change, including moving to a low carbon economy.*

2.3 SITE DESCRIPTION

The site is located in the centre of Manchester, the surrounding area is a mix of non-domestic and domestic spaces. It is in close proximity to iconic buildings such as the Town hall and Central Library. Being a city centre location there is a strong presence of local retail and various amenity, also nearby to the development is the Spinningfields Business District, Civic Quarter and Chinatown.

Figure 4: Ariel View

2.4 PLANNING POLICY

2.4.1 Local Policy

The locality of the development site means it falls under the jurisdiction of Manchester City Council. As such the policies adopted by Manchester City Council must be adhered to.

The document that details Manchester's strategy for development is 'Manchester's Local Development Framework – Core Strategy Development Plan Document', throughout the remainder of this report it shall be referred to as Manchester Core Strategy. The Core Strategy was adopted 11th July 2012.

Policy EN 4:
Reducing CO2 Emissions by Enabling Low and Zero Carbon Development

The Council will seek to reduce fuel poverty and decouple growth in the economy, growth in CO2 emissions, and rising fossil fuel prices, through the following actions:

- *All developments must follow the principle of the Energy Hierarchy, being designed to reduce the need for energy through design features that provide passive heating, natural lighting and cooling*
- *To reduce the need for energy through energy efficient features such as improved insulation and glazing*
- *To meet residual energy requirements through the use of low or zero carbon energy generating technologies*
- *Wherever possible new development and retrofit projects, including energy generation plant, must be located and designed in a manner that allows advantage to be taken of opportunities for low and zero carbon energy supplies*
- *Where possible new development and retrofit projects will be used as a mechanism to help improve energy efficiency and provide low and zero carbon energy supplies to existing buildings*
- *Where appropriate new development and retrofit projects will be required to connect to and/or make contributions to low or zero carbon energy schemes and/or to incorporate provision to enable future connection to any existing / potential decentralised energy schemes*

Policy EN 6
Target Framework for CO_2 reductions from low or zero carbon energy supplies

Applications for residential development of 10 or more units and all other development over 1,000 sq m will be expected as a minimum to meet the target shown in Tables 12.1 or 12.2, unless this can be shown not to be viable. This should be demonstrated through an energy statement, submitted as part of the Design and Access Statement. Such a statement will be expected to set out the projected regulated energy demand and associated CO_2 emissions for all phases of the development.

Developments smaller than the above threshold but involving the erection of a building or substantial improvement to an existing building will also be expected to meet the minimum target, where viable, but will not be expected to submit an energy statement.

The target framework relates to three broad development locations and their potential for low and zero carbon, decentralised energy. The areas are defined as follows:

- *Target 1 Network development areas: Locations where the proximity of new and existing buildings, the mix of uses and density of development provide the right conditions to support district heating (and cooling)*

- *Target 2 Electricity intense areas: Locations where the predominant building type has an all-electric fit-out such as retail units and leisure complexes*
- *Target 3 MICRO-GENERATION AREAS: Locations where lower densities and a fragmented mix of uses tend to mean that only building scale solutions are practical*

Policy EN 8:
Adaptation to Climate Change

The council outlines an indicative list of remedial actions for new developments in order to be adaptable to climate change in terms of design, layout, siting and function:

- *Minimisation of flood risk by appropriate siting, drainage, and treatment of surface areas to ensure rainwater permeability*
- *Reduction in urban heat island effect through the use of Green Infrastructure such as green roofs, green walls, increased tree cover and waterways*
- *The need to control overheating of buildings through passive design*
- *The opportunity to provide linked and diverse green space to enhance natural habitats which will assist species adaptation*

Domestic CO_2 emission targets
Table 12.1

Target	***% Minimum requirement***
Target 1: Network development area	*CHP/district heating anchor or connection or where not feasible a 15% increase on Part L 2010*
Target 2: Electricity intense buildings	*+15% increase on Part L 2010*
Target 3: Micro generation area	*+15% increase on Part L 2010*

Non-domestic CO_2 emissions reduction targets
Table 12.2

Target	***% Minimum requirement***
Target 1: Network development area	*CHP/district heating anchor or connection or where not feasible a 15% increase on Part L 2010*
Target 2: Electricity intense buildings *(applies to commercial uses with a high proportion of emissions from electricity use (>45kgCO2/m2)*	*+15% increase on Part L 2010*
Target 3: Micro generation area	*+15% increase on Part L 2010*

Where the CO_2 emissions reduction required under any future revision to Part L of the building regulations become greater than the '% minimum requirement', the reduction required under building regulations would apply.

Where the Council identifies an 'allowable solution', for example within an energy proposals plan, that would produce higher carbon reductions at no extra cost than that of achieving the '% Minimum requirement' (or required under building regulations if greater) the higher percentage reduction will be required. The cost comparison is based on the cost of incorporating the 'allowable solution' at design stage.

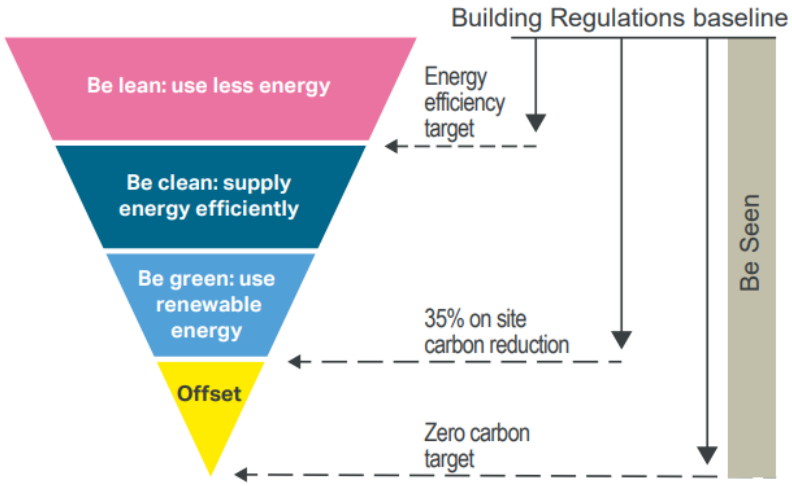
The energy statement will be required to be submitted at the outset of any proposed development (outline application or before). Developers will be permitted to use green infrastructure elements such as green roofs, green walls, street trees and waterways to contribute to compliance with CO_2 mitigation, subject to the energy statement incorporating evidence such as modelling to demonstrate compliance.

Guidance on what the energy statement should contain and how to decide which target applies to a development proposal is given in appendix A.

The above policy states that this specific development requires a 15% betterment with CO_2 emission reduction over 2010 Building Regulations. However, the development will be constructed to adhere to 2013 Building Regulations whilst providing estimate Part L 2021 Building Regulations results.

There have been 2nr updates to Part L since the introduction of the above Policy target CO_2 reduction. The first being the Part L 2013 update and the second being the Part L 2021 update. The collective betterment of the 2nr Part L updates over Building regulations 2010 is 37% (6% from 2010 to 2013 and 31% from 2013 to 2021). Therefore, by achieving a pass under current 2021 Building Regulations the development will not only meet the required CO_2 reduction in Policy EN8 but exceed it by 22%.

Furthermore Section 4 Environmental Standards of the Manchester Supplementary Planning Document details the requirement for and Environmental Standards Statement highlighting a number of Environmental issues be addressed. These issues are addressed in Section 5 of this report.



2.4.2 Energy Hierarchy

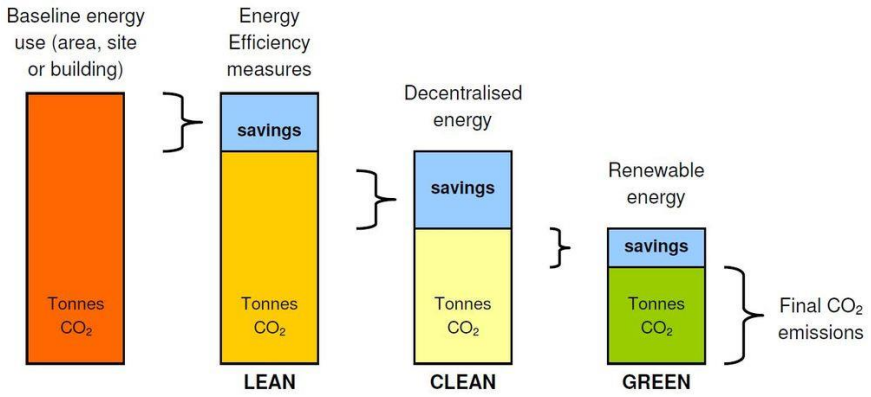
As part of the Sustainability and Energy analysis of the development Energy Hierarchy has been used as a means of structuring the sustainable design process.

We have taken this approach in order to properly address the Manchester Core Strategy Policies which promote low carbon design, assessment of connection to CHP and consideration of other low – zero carbon technologies.

An overview of the Energy Hierarchy is provided below:

Figure 5: Energy Hierarchy Diagram

- Using less energy, in particular by adopting sustainable design and construction measures.
- Supplying energy efficiency, in particular by prioritising decentralised energy generation; and
- Using renewable energy.



The development Energy strategy has adopted the following design ethos:

- **BE LEAN** – By using less energy and taking into account the further energy efficiency measure in comparison to the baseline building.

- **BE CLEAN** – By supplying energy efficiently. The clean building looks at further carbon dioxide emission savings over the lean building by taking into consideration the use of decentralise energy via CHP.

- **BE GREEN** – By integrating renewable energy into the scheme which can further reduce the carbon dioxide emission rate.

2.5 BUILDING REGULATIONS

Approved document L1A (2013)– Conservation of fuel and Power sets the standard for carbon emissions for new dwellings. Buildings will need to comply with the criteria set out in the document, as follows:

Approved document L1A – Conservation of fuel and Power sets the standard for carbon emissions for new dwellings and was revised last April 2014 (Part L: 2013). Dwellings will need to comply with the criteria set out in the document, as follows:

1) The predicted Dwelling CO_2 Emission Rate (DER) should not be greater than the Target CO_2 Emission Rate (TER).

2) The performance of the building fabric and fixed building services should be no more than the design limits set out in Table 2 of the approved Document.

3) The dwelling will have appropriate passive control measures to limit the effect of solar gains on indoor temperatures in summer.

4) That the performance of dwellings as built comply with DER values achieved, including site testing or a representative sample of dwellings, demonstrating that the 'air permeability' rate achieved is as per that specified, or better.

5) The necessary provisions for energy efficient operation of dwellings are put I place, including operation and maintenance instructions

Approved document L2A (2013)– Conservation of fuel and Power sets the standard for carbon emissions for new buildings other than dwellings. Buildings will need to comply with the criteria set out in the document, as follows:

In order to demonstrate compliance with the requirements for Approved Document L2A (2013) there are five separate criteria that must be met.

The following briefly outlines each of the five criteria:

(i) Criterion 1 - Achieving the Buildings Emission Rate (BER)

To demonstrate compliance with Criterion 1 the actual building emission rate is compared to the notional building emission rate and must be at least equal.

The actual buildings emission rate is calculated when the building is modelled using approved software and the proposed construction values are detailed, for example, u-values, efficiency of M&E plant, etc. following this exercise the software will generate a notional building, the notional building has the same layout as the actual building, but the construction values and energy performance of the M&E equipment is pre-set, this allows the software to generate a target emission rate (TER) for the actual building, the TER is the anticipated emission rate from the notional building.

The BER is then compared to the TER and if it is equal to or lower than then the building is deemed to comply with Criterion 1.

This process needs to be completed and issued to Building Control at the "As-Designed" Stage to demonstrate to Building Control that the proposals for the building comply with the criteria.

(ii) Criterion 2 - Limits on Design Flexibility

Each element of the construction has pre-set performance limits within the document; these are generally split into 2 categories, an average value and an upper limit value which cannot be exceeded.

To demonstrate compliance with criterion 2 then criterion 1 must be achieved with no individual element exceeding the upper limit set for performance.

(iii) Criterion 3 - Limiting the Effects of Solar Gains in Summer

It is a requirement to demonstrate that solar gains have been limited during the summer period to either reduce the need for air conditioning; or to reduce the installed capacity of any air conditioning system that is installed.

To demonstrate compliance with criterion 3 an assessment of the solar gains must be undertaken, the actual building results are then compared to a pre-defined standard and if the performance of the actual building is no worse than that of the pre-defined building then it is deemed to comply with the criterion.

(iv) Criterion 4 – Building Performance Consistent with BER

The process for demonstrating compliance with criterion 4 is generally the same as criterion 1, the difference is that the actual building performance is compared to the notional building, for example, the air permeability results, building services commissioning figures, achieved construction u-values are used rather than the design assumptions.

It then must be demonstrated that the actual building performance is equal to or better than the TER.

Notice should be given that commissioning has been carried out according to a procedure approved by the Secretary of State.

(v) Criterion 5 – Provisions for Energy-Efficient Operation of the Building

The owner of the building should be provided with sufficient information about the building, the fixed building services and their maintenance requirements so that the building can be operated in such a manner as to use no more fuel and power than is reasonable in the circumstances.

This is generally achieved by production of a building logbook.

2.5.1 The Introduction of SAP 10

The new methodology under Part L 2021 has several aspects that make Part L more stringent to achieve in general, however one major change is the Fuel Carbon Factors for each of the fuel applied within the calculation for energy generation. The change is specific to the grid electricity, this fuel factor is to be lowered to fall in line with gas.

This change makes an all-electric heating and hot water system in line with a gas system in terms of efficiency, therefore gas and CHP systems will have less of a benefit within the new calculations. This coupled with the benefits of removing gas from certain sites has huge advantages for developments such as this.

This change in the fuel factor is a direct result of the "greening of the grid" which has occurred due to the current proportion (circa 48%) of grid energy now coming from renewable sources, primarily offshore wind, solar PV and Biomass generators. There is a focus on the use of all electric heating and hot water systems within our recommendation to take advantage of the new fuel factors coming out in SAP 10 and support the policies of the Manchester Core Strategy by using an all-electric system supplied by grid electricity which will eventually become a zero-carbon energy source.

2.5.2 RIBA 2030 Climate Challenge

In addition to the upcoming fuel carbon factors this Energy Strategy has also given consideration to the RIBA 2030 Climate Challenge.

The RIBA 2030 Climate Challenge sets out a number of Sustainable Outcome targets including:

- Operational Energy
- Embodied Carbon
- Potable Water Use

It also sets out a number of best practice Health Targets including:

- Overheating
- Daylighting
- CO_2 Levels
- Total VOC's (Volatile Organic Compounds)
- Formaldehyde

The RIBA 2030 Climate Challenge was created following the RIBA Council vote on 29th June 2019 to join the global declaration of an environmental and climate emergency. These targets are none binding and still under development as RIBA discusses these metrics further with industry bodies before the targets are finalised. They do however make a useful resource for best practice given that these targets were developed to address the current climate emergency, therefore, although the targets are non-binding they have been considered where appropriate.

Above is an extract showing the target metrics for domestic and non-domestic buildings. Particularly relevant to this report are the "Operational Energy" and "Potable Water Use" targets as through a fabric first approach, low/zero carbon technology and use of renewables these issues have been considered.

The Embodied Carbon target is addressed as far as our capacity as the Sustainability Consultant is concerned however in order to fully tackle the Whole Life Carbon of the building using Circular Economy Strategies; consideration of Embodied Carbon will be required by all parties involved with the design, construction and operation of each block, particularly parties with ISO14001 accreditation.

We have endeavoured to achieve the targets outlined through the fabric first approach combined with Low Carbon technology and efficient fittings all of which are detailed further in this report.

3 DESIGN PARAMETERS

3.1 METHODOLGY

The Standard Assessment Procedure (SAP) is the Government's approved methodology for assessing the predicted energy consumption and carbon dioxide emissions for new domestic developments. SBEM is the Simplified Building Energy Model which is the methodology for assessing non-domestic developments.

Results are derived in respect of floor area and consider energy use (kWh/m^2/yr) and associated CO_2 emissions (kg.CO_2/m^2/yr) from the following:

- Space heating
- Domestic hot water
- Ventilation
- Lighting
- Ancillary pumps and fans
- Energy generation technology

SAP/SBEM is compliant with the EU Energy Performance of Buildings Directive and is carried out using approved software. For the purpose of this report, data has been produced by an Accredited Energy Assessor using FSAP and IES software to produce the data for this report.

To enable a review of each level of the Energy Hierarchy, firstly the Baseline CO_2 emission figures must be established. These figures are based on Part L1A/L2A 2013's 'Notional Building', a specific set of specification criteria referenced in section 3.4 of this report.

All additional measures included to reduce the overall CO_2 emissions such as improved building fabric and low carbon technology will be compared against the Baseline figures. These figures are the Target Emission Rate derived from the SAP assessment and resulting Design Stage SAPs.

A 'fabric first' approach will be undertaken throughout this report, looking at improvements to the thermal envelope initially to understand the improvements that can be gained prior to the feasibility of any renewable / low carbon technologies.

Renewable / low carbon technologies will then be considered with regards to special constraints, feasibility, and appropriateness in relation to the site.

NOVO Integration Ltd have used the following information to formulate the Energy Strategy.

The above table summarises the emission factors for all fuel types, this is provided in the latest BRE Technical Paper on CO2 and Primary Energy Factors for SAP. As you can see the SAP 10 fuel factor for grid electricity is vastly improved over the 2012 version, hence the SAP 10 software has been used to produce the results shown later in this report.

3.4 BASELINE CO_2 EMISSIONS

For the purpose of this report the baseline energy use and CO2 emissions are calculated based on the 'Notional Dwelling' requirements specified in the Building Regulations L1A 2013 (Table 5).

By using low u-values and high-performance materials to reduce greenhouse emissions, the Be Lean stage of this report is in accordance with Paragraph 150 of the National Planning Policy Framework (NPPF). Furthermore, the use of low u-values in conjunction with accredited details demonstrates an effort to reach the Operational Energy and CO_2 emission targets of the RIBA 2030 Climate Challenge.

The following table details the notional baseline area weighted CO_2 regulated emissions for the development. The target emission rates (TER's) in the above figures combined with the total floor area was used to produce the baseline CO_2 emissions below.

Table 9 Estimated Baseline Carbon Emissions 2012 Building Regulations

Building Services	Baseline CO2 Emissions (kg CO_2/m2/yr)	Baseline CO_2 Emissions for overall development (kg CO_2/ yr)
Total regulated emissions (heating, hot water, lighting, fans & pumps)	25.12	1,163,460

Table 10 Estimated Baseline Carbon Emissions 2021 Building Regulations

Building Services	Baseline CO2 Emissions (kg CO_2/m2/yr)	Baseline CO_2 Emissions for overall development (kg CO_2/ yr)
Total regulated emissions (heating, hot water, lighting, fans & pumps)	8.67	378,720.4

By using low u-values and high-performance materials to reduce greenhouse emissions and improve energy efficiency; the Be Lean stage of this report addresses policies EN4 and EN6 of the Manchester Core Strategy and is in accordance with Paragraph 8 of the National Planning Policy Framework (NPPF) by reducing CO_2 emissions and supporting a low carbon economy.

Section 4 below will now detail how the reduction between the dwelling emission rate (DER) and the target emission rate (TER) has been achieved.

4 ENERGY STRATEGY

4.1 ENERGY EFFICIENT DESIGN

This section outlines the design energy efficient measures taken to minimise the building's energy demand and therefore reduce energy use and CO_2 emissions further than the baseline notional building, often referred to as the 'Fabric First' approach.

The energy efficient measures include:

a) Inclusion of better U-values than the minimum U-values set in the ADL1A
b) Designing for a buildings air permeability exceeding ADL1A target values
c) Utilising the highly efficient heating and hot water systems
d) Utilising low energy efficient lighting such as LED lighting

The table below outlines the improvements made to the building fabric elements compared against both the Building Regulations limiting U-values and the 'Notional Dwelling' U-values which the baseline is derived from.

Table 11 Proposed Building Fabric Specification

Building Fabric			
Element	**L1A: 2013 Limiting U-values (W/m².k)**	**L1A: 2013 Notional U-values (W/m².k)**	**Proposed U-values (W/m².k)**
Floors	0.25	0.13	0.18
External Walls	0.30	0.18	0.24
Party walls between dwelling	0.20	0.00	0.00
Roof	0.20	0.13	0.15
Windows	2.00	1.40	1.1 (g-value 0.4)
Doors	2.00	1.0	N/A
Y – value (W/m².k)	0.15	~0.05	~0.07 – 0.12
Air permeability (m²/h.m² @ 50 pa)			
All dwellings	10.0	5.0	5.0

The above table shows that all fabric elements are improved over the limiting values, the fabric strategy has focussed on improving the glazing element as this element forms a large part of the overall fabric. Focussing the fabric efficient design here is therefore an effective method of maintaining the fabric first ethos.

4.1.1 Heating Demand

The heating energy demand will be reduced by providing high performance insulation of the building envelope as well as a low Air Permeability Target to minimise heat losses. Thermal Bridging will also be reduced through insulation to all relevant junctions to achieve Psi values associated with accredited construction details (for all PSI values refer to Table 1 in this report).

For the domestic aspect of the development, low carbon Air Source Heat Pumps have been chosen to provide heating and cooling to the apartments. This will be supplemented by mechanical ventilation with heat recovery that will reuse waste heat to lower the energy demand of the main heating system. Hot water will be provided by a dual electric immersion cylinder which has a 100% delivery efficiency.

The non-domestic aspect will largely follow the general strategy of the apartments using both ASHP's and MVHR for heating and ventilation. Circulation/WC areas will be serviced by electric panel heaters which also have a 100% delivery efficiency. Hot water will be provided by a QAHV ASHP in the case of non-domestic areas with some instances of electric water heaters.

As this strategy effectively reduces the reliance on fossil fuels and contributes to the overall CO_2 reduction of the development, it therefore addresses Policy EN6 of the Manchester Core Strategy whilst also adhering to paragraph 150 of the National Planning Policy Framework (NPPF).

4.1.2 Ventilation

The development will take advantage of a Mechanical Ventilation Heat Recovery (MVHR) system.

Occupants will also have a natural ventilation option via the openable balcony doors where applicable. Extract fans will be included to all wet areas and in the kitchens.

MVHR is, in its simplest form is a heat exchanger. The system extracts warm stale air from within the Building, at the same time drawing in cooler fresh air from outside. These are then ducted into the actual MVHR unit itself, at which point the heat is exchanged without mixing the air, therefore fresh, warm air is vented into the building.

This system recovers heat from within the units which otherwise would be lost, therefore reducing the amount of energy required to maintain temperature within the units.

4.1.3 Lighting

The proposed light fittings will be low energy efficient fittings, in this instance LED fittings only throughout.

4.1.4 Embodied Carbon

All materials used within the construction of the development will have embodied carbon within them, taking into consideration manufacturing processes and supply chains. It is assumed that the developer will seek to procure materials and construction elements with appropriate sustainable accreditations, for example FSC for timber, ISO:140001 accreditations where applicable etc, to minimise the use of high embodied carbon within the building.

4.2 CO_2 REDUCTIONS AFTER FABRIC FIRST APPROACH

The following table demonstrates the reduction in CO2 emissions based on an area weighted average calculation utilising a fabric first approach with no reduction incorporated from the inclusion of any renewable / low carbon technology:

Figure 12: Fabric First Results SAP 2012

Figure 13: Fabric First Results SAP 10

Regulated Emissions	Baseline CO_2 Emissions	Fabric First Building CO_2 Emissions	CO_2 Emission Savings	% Reduction in CO_2 Emissions

kg of CO2/yr	378,720.4	294,356.19	84,364.21	

From the figures above, the overall CO_2 reduction complies with SAP 2012 and through the SAP 10 Part L 2021 calculation, the required 9% reduction in CO_2 has been exceeded. This is due to the more up to date and accurate fuel factors applied to grid electricity.

The Dwelling Fabric Energy Efficiency (DFEE) results also show an improvement over the baseline this shows that the fabric first approach is at the forefront of this strategy and is therefore not overly reliant on updated fuel carbon factors or highly efficient Mechanical systems.

- Target Fabric Energy Efficiency 39.15 kWh/m^2/yr.
- Dwelling Fabric Energy Efficiency 34.85 kWh/m^2/yr.
- Reduction % =10.98%

4.3 CLEANER ENERGY - CHP & DECENTRALISED ENERGY NETWORKS

The Energy Hierarchy encourages the use of a CHP system and/or the connection to District Heating system to reduce CO_2 emissions further.

4.3.1 CHP

The Energy Hierarchy identifies combined heat and power (CHP) as a method of producing heat and electricity with much lower emissions than separate heat and power. Also, it encourages the creation of district heating systems supplied by CHP.

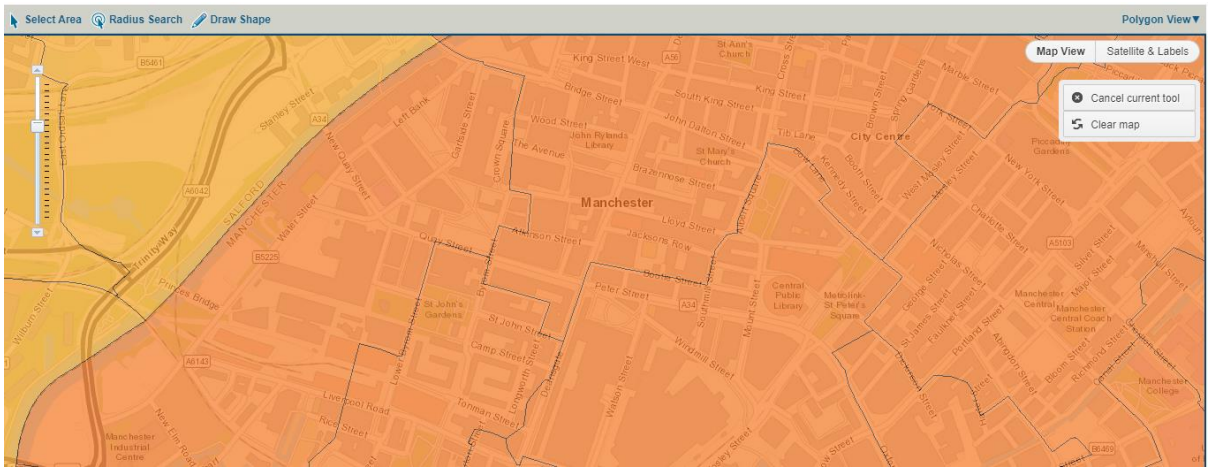
The implementation of a CHP strategy should be decided according to good practice design. Key factors for the efficient implementation of the CHP system are:

- Development with high heating load for the majority of the year
- CHP operation based on maximum heat load for minimum 10 hours per day
- CHP operation at maximum capacity of 90% of its operating period

A CHP system will not be considered for this development due to the following reasons:

- Due to restrictions on site space would be limited for the level of plant required for a CHP system, which would require accumulators, additional boiler power, pumps, pressurisation units etc.
- Pollution discharged from the CHP unit may not be appropriate given the site locality and the number of people passing the site given its location within a residential area.
- Noise pollution is a consideration given the function of the development and its proximity to other surrounding buildings.
- Economic viability is heavily dependent on the constant demand for heat and power, as well as the price of electricity and gas.

- An all-electric system has been used in this strategy to take advantage of upcoming fuel factors for grid electricity and provide some level of future proofing as grid electricity closes in on carbon neutrality over time.



Hence, the implementation of a CHP strategy is not recommended for this development.

As a result, no CO_2 reduction can be achieved as part of the Be Clean section of the Energy Hierarchy.

4.3.2 Decentralised Energy Network

The feasibility of connecting into an existing heating network or providing the building with its own combined heat and power plant has been assessed through the use of UK CHP Development Map, for Manchester as for a District Heating network.

Figure 12: CHP Development Map – Local Heat Loads

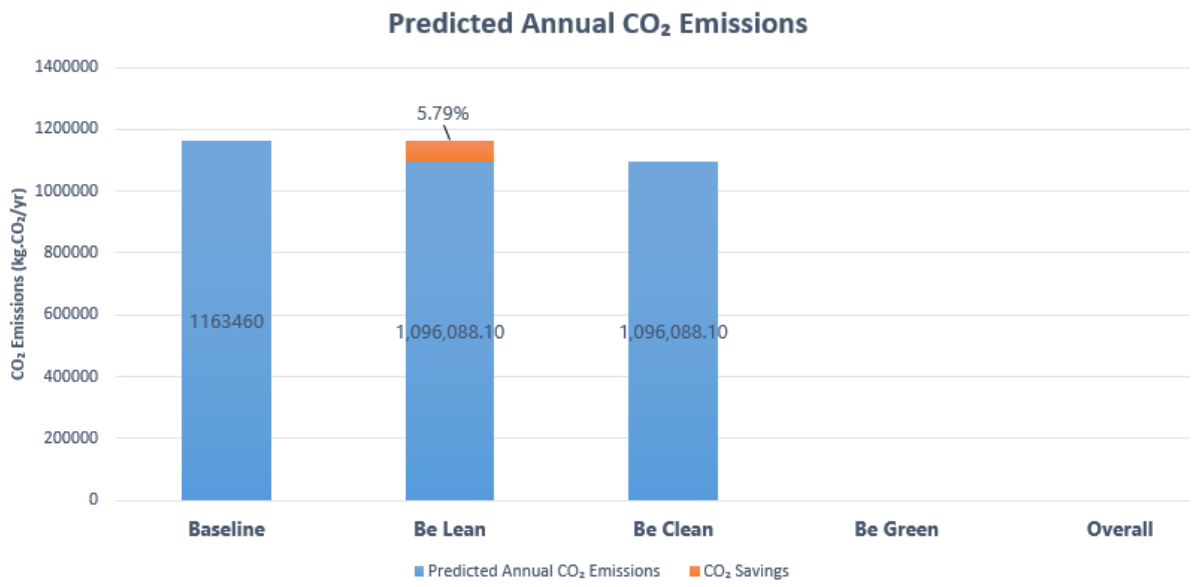
Presently there is the potential to connect to a heat network and should the District Heating Network evolve into an all-electric system and the infrastructure for such be provided then connection could be considered in the future.

Heat networks are best suited to large developments with appropriate plant space for buffer vessel, plate heat exchangers and manifold positions, meters, furthermore the pipework required for connection to each unit makes this option financially unviable.

An all-electric strategy is the preferred option as the fuel carbon factor for grid electricity is to be brought in line with natural gas and will eventually become zero carbon as the portion of renewable energy supplied to the grid increases. This therefore provides the development with some future proofing, better addresses the current climate emergency by removing another potential source of emissions and supports the RIBA 2030 Climate Challenge through a low carbon heating and hot water solution.

As such no additional CO_2 reduction can be observed at the Be Clean stage, this is described in the graph below:

Figure 13: Be Clean Carbon Emissions SAP 2012 Result



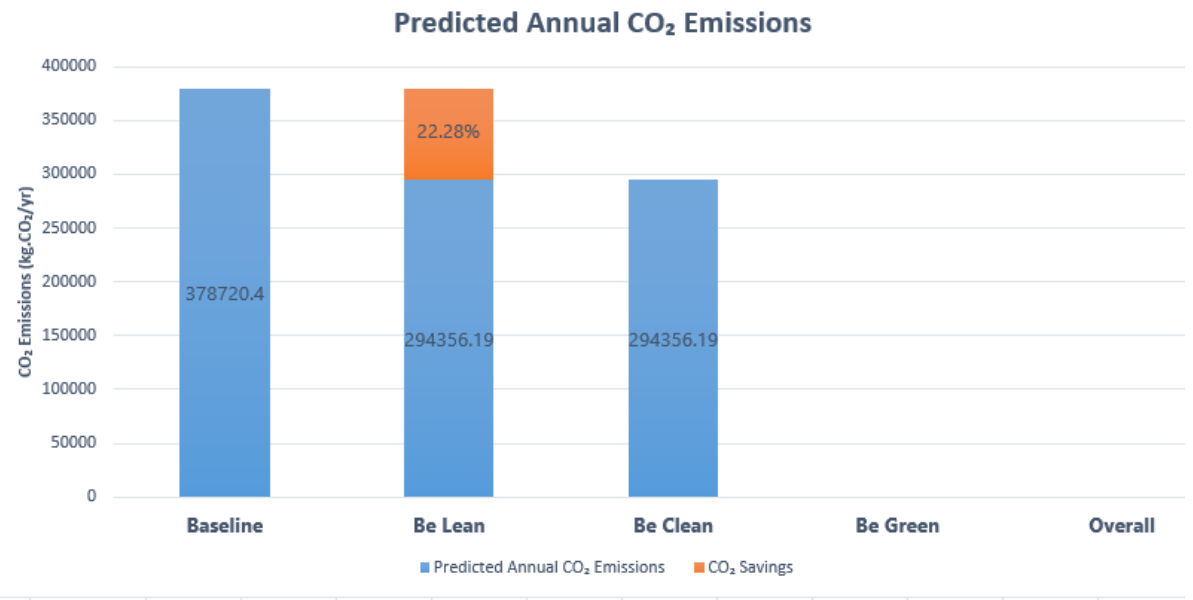


Figure 14: Be Clean Carbon Emissions Estimated SAP 10 Result

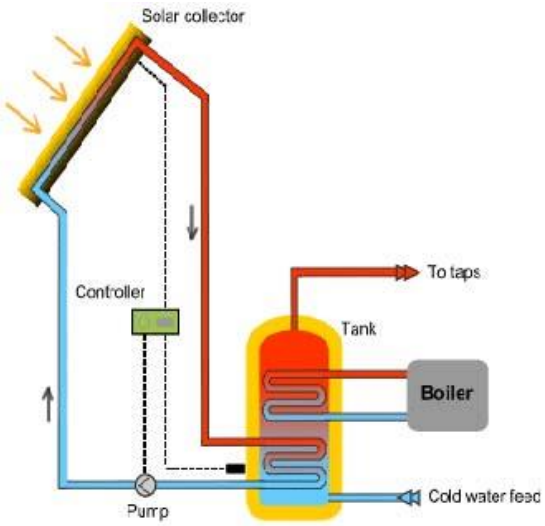
4.4 LOW & ZERO CARBON TECHNOLOGIES

4.4.1 General

Low and zero carbon (LZC) technologies are systems that generate energy with either zero or reduced CO2 emissions when compared against traditional energy generation methods.



The alternative LZC technologies have been assessed in relation to the development and their viability assessed. Some of the LZCs are intrinsically unsuitable due to the development type and location whereas others are potentially viable.

4.4.2 Solar Water Heating

Solar thermal panels utilise the sun energy to generate hot water for use within the building. The panels are commonly provided in either flat plate or evacuated tube arrangements. The panels are ideally located facing south at an approximate 30° inclination angle in areas where they are not subjected to shade.

This system alone would not generate a large enough CO_2 reduction in proportion to other comparable technologies. This technology has also been discounted due to the inflated cost of installation with regards additional pipe runs, maintenance requirements and the significant roof area that would be required.

Figure 15: Solar Thermal Diagram

4.4.3 Wind Turbines

Wind turbines generate electrical energy derived from kinetic energy provided by the local wind resource. The performance of wind turbines depends greatly on the wind speed and turbulence that in turn is influenced by the terrain and installation height.

Figure 16: Typical Small Scale 6kW Wind Turbine

The use of wind turbines on the development will also have a significant visual impact on the city centre location and neighbouring buildings, as well as low frequency noise source and hence it is likely to meet opposition within the local area.

In very simplistic terms, space for such a large technology on this development site cannot be considered.

For the reasons detailed above wind turbines are not considered viable for the development.

4.4.4 Photovoltaic Cells (PV)

Photovoltaic (PV) panels utilise the sun's energy to generate electricity. The optimum location for PV panels is south facing at an approximate 30-45° inclination angle in areas where they are not subjected to shade.

Figure 17: PV Examples

PV technology has been discounted from this strategy due to limited roof space for installation, furthermore there is limited plant space to accommodate inverters. The requirements of Part L and the Manchester Core Strategy can be met through fabric efficiency and low carbon M&E design, PV is

therefore not required on this development and would be impractical to install given the nature of building as a tower block with limited roof area.

4.4.5 Source Heating and Cooling

The Air Source Heat Pumps can be linked with indoor units to heat and cool the space. These could be either ceiling mounted cassette units, wall mounted units or floor mounted units. This option therefore has good flexibility in terms of installation. The outdoor units can be located anywhere and are not dependant on orientation. They need to be externally mounted and in a local compound to be safe.

ASHP technology has been included within the design to provide heating and cooling to domestic and non-domestic areas. This technology will also service part of the non-domestic hot water demand. ASHP's benefit from a simple installation process and low maintenance. Furthermore, they are very efficient with respect to energy produced vs energy used, for every 3-4 units of energy produced only 1 unit of energy is used. This technology has been chosen for its excellent carbon performance which best addresses the requirements of Part L, the Manchester Core Strategy, and the RIBA 2030 Climate Challenge.

4.4.6 Biomass Boiler

Biomass is considered to be a renewable fuel source as the CO_2 absorbed during the growth period is assessed as being approximately equal to the CO_2 emitted during combustion and hence deemed "carbon neutral". Biomass for boilers is typically wood either in chip or pellet form.

Biomass boilers require fuel storage together with associated transportation and delivery to the store location.

Figure 18: Biomass Example

With the minimal plant areas available for a biomass generator combined with the logistics and increase in pollution from wood pellet deliveries/transportation, biomass generators have not been included in this Energy Strategy.

For the above reasons, the use of a biomass boiler plant is not considered viable for the development.

4.4.7 Fuel Cell

The fuel cell technology essentially converts chemical energy into both electrical and heat energy. The cell needs to be continually supplied with hydrogen (derived from either a piped or storage source) and oxygen (derived from air) that are combined and the chemical reaction produce electrical energy, heat energy and water vapour.

The fuel cell requires a hydrogen fuel source that can either be from a piped source (not currently available) or from stored gas. However, the more usual approach currently in the UK is to use natural gas in order to generate the hydrogen required to operate the fuel cell.

Fuel cells have various commercial and technical limitations. There is a high initial capital cost together with there being few established suppliers and a very limited specialist design, installation, and maintenance capabilities.

Certain fuel cell elements require regular replacement imposing a significant on-going cost implication. The fuel cells themselves are generally large, heavy and require fresh air ventilation.

Due to the initial capital cost, space requirements and on-going maintenance costs fuel cells are not considered viable for this development.

4.5 WATER

The development will be designed to reduce mains/potable water and include water efficient devices and equipment. This will comprise of efficient water fixtures (low flow taps and showers, dual flush WCs and low volume baths) to reduce potable water demand to <16 litres/person/day as per the requirement within Building Regulations.

As stated previously <16 litres/person/day is the 2020 target in the RIBA 2030 Climate Challenge and the next target 2025 is <13 litres/person/day, this surpasses the requirement of Part G and we will use our best endeavour to reach this target.

This will be done using low flow rate sanitaryware and the use of flow restrictors throughout the development.

An example of the flow rates and capacities that could potentially be used are as follows. Please note these are a guide at this stage and actual figures may differ at the time of construction. However, they will fall within the required level:

- WC – Dual Flush – 6/3 Litre Flush capacity
- Wash hand basin taps – 5 L/min
- Kitchen sink taps – 7L/min
- Shower – 7L/min

4.6 CHOSEN RENEWABLE SOLUTION

Following the above review of various LZC technology the chosen solution for this strategy is to utilise low carbon air source heat pumps to provide heating and cooling. This would be used in conjunction with the fabric efficiency improvements as described at the Be Lean stage which; at present can satisfy the required CO_2 reduction stated in the current Manchester Core Strategy 2012 without the inclusion of any additional renewable technology.

As such no additional CO_2 reduction can be observed at the Be Green stage.

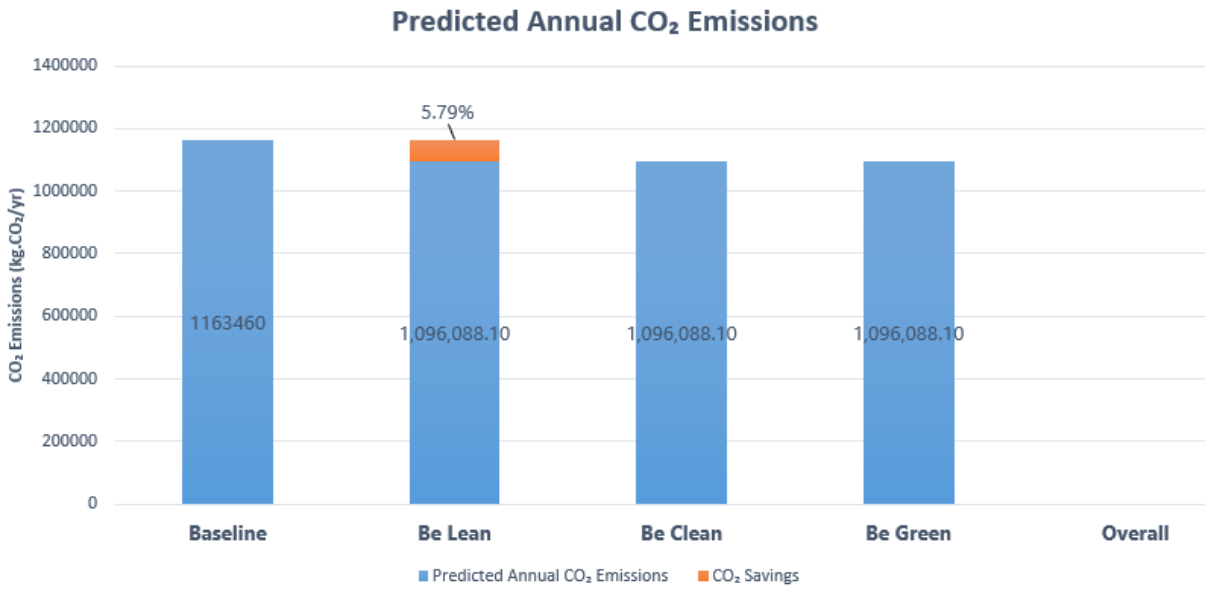

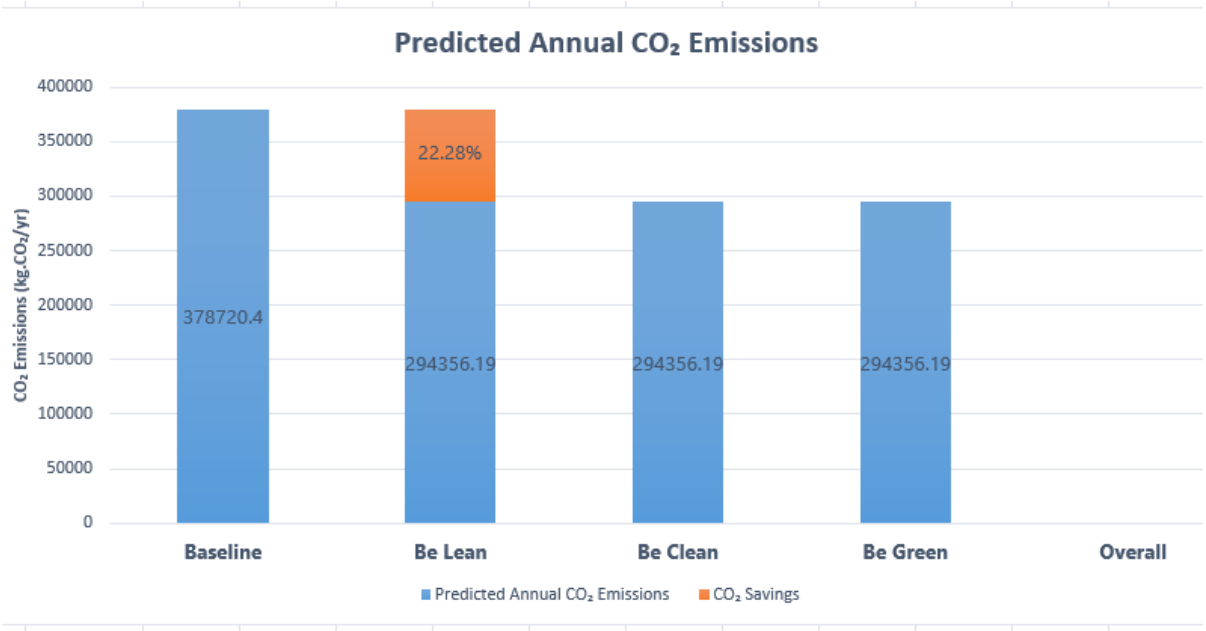

Figure 20: Be Green Carbon Emissions Estimated SAP 10 Results

4.7 PRIMARY ENERGY DEMAND & RIBA 2030 CLIMATE CHALLENGE

In order to calculate the energy demand for the entire development in kWh/yr the following is required.

The energy demand is made up of the following factors:

- Energy for space heating
- Energy for space cooling
- Energy for water heating
- Energy for ventilation
- Energy for lighting
- Energy generated by renewables

This is more specifically the Primary, Regulated Energy Demand given the fabric, considering the above factors.

The estimated SAP 10 primary energy demand results are displayed in the below table for typical units.

Table 14 Primary Energy Demand Typical Units

Unit	**Energy Demand** kWh/m^2/yr
Typical 1 bed unit Level 18	67.79 kWh/m^2/yr
Typical 2 bed unit Level 18	67.92 kWh/m^2/yr
Typical 2 bed unit Level 26	59.21 kWh/m^2/yr
Typical 2 bed unit Level 37	49.61 kWh/m^2/yr
Typical 3 bed unit Level 37	35.33 kWh/m^2/yr
Duplex Level 41	50.21 kWh/m^2/yr

This is a decent improvement on the current benchmark target of 105 kWh/m^2/yr and achieves the current RIBA 2030 Climate Challenge 2025 Target of < 70 kWh/m^2/yr. It is worthy of note however that RIBA intend to work with professional bodies to finalise their target metrics which may change as those discussions progress.

The Part L1A CO_2 reduction results also contribute to the embodied carbon targets with a 22.28% reduction in kg CO_2/m^2 being achieved through the use of fabric improvements alone as per the Be Lean stage of this report.

The non-domestic Operational Energy demand currently stands at around 82.48 kWh/m^2/yr which also achieves the 2025 target shown in the figure below.

Potable Water Use Litres/person/day	>16 l/p/day (CIRA W11 benchmark)	< 16 l/p/day	< 13 l/p/day	< 10 l/p/day	CIBSE Guide G

As stated in section 2.5.2 The Embodied Carbon target is addressed only as far as our capacity as the Sustainability Consultant is concerned. In order to fully tackle the Whole Life Carbon of the building using Circular Economy Strategies; consideration of Embodied Carbon will be required by all parties involved with the design, construction and operation of the development, particularly parties with ISO14001 accreditation.

The RIBA 2030 Climate Challenge targets are ultimately non-binding however indicate good practice; we have therefore endeavoured to achieve the targets outlined.

5 CONCLUSIONS

The Energy Strategy for the proposed development St Michaels Manchester has adopted a hierarchical approach of using passive and low energy design technologies to reduce the baseline energy demand and hence CO_2 emissions followed by the feasibility of the application of low and zero carbon technologies as appropriate.

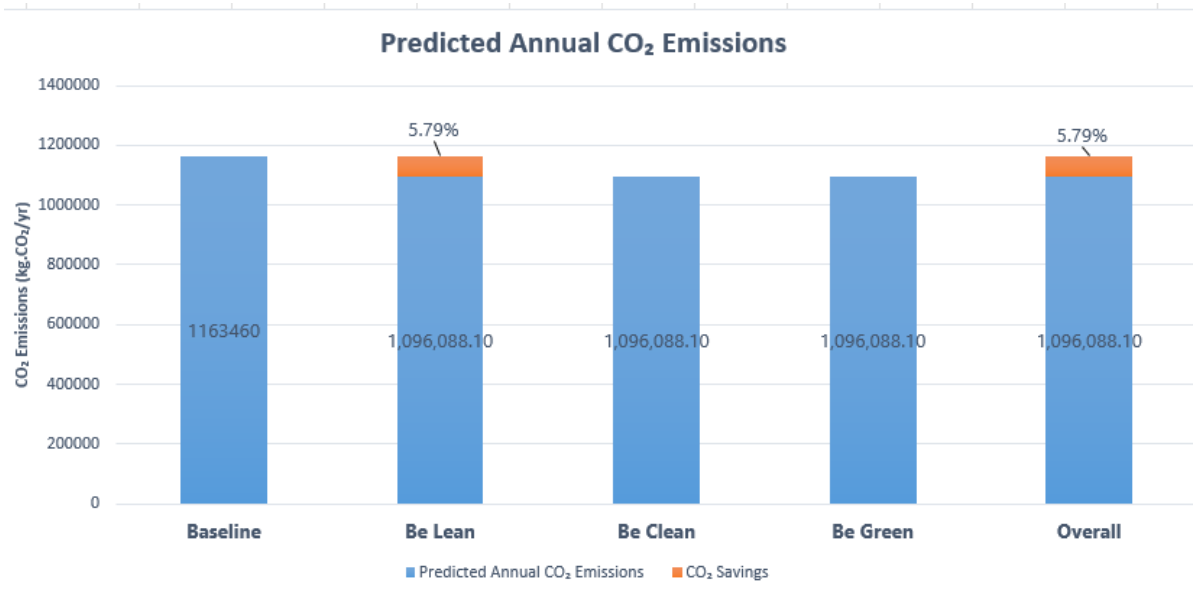
This is supported by the SAP/SBEM Calculations to provide compliance in England with the Building Regulations Part L, as current SAP 10 software has not fully released, reporting functionality is limited however reports can be produced as the software develops. The analysis has shown that by incorporating passive and low energy design measures, compliance with Part L 2012 is achieved. Furthermore, an estimated SAP 10 calculation shows that on-site CO_2 has been reduced over the baseline calculation by 22.28% therefore achieving the required 15% reduction over 2010 Building Regulations as stipulated in the Manchester Core Strategy.

This is achieved by incorporation of the following elements:

- Improved thermal transmittance U-valued as depicted.
- Air source heat pumps
- Mechanical Ventilation Heat Recovery systems with 88% heat recovery efficiency
- Highly efficient low carbon Air Source Heat Pumps
- Low building air leakage rate (5.0 m^3/h/m2 at a pressure differential of 50 Pa)
- 100% Low energy lighting through the buildings
- Low flow aerated showerheads and basin tap inserts to reduce water consumption
- Reducing mains/potable water via water efficient devices and equipment

A 'Fabric First' approach has been used in this strategy then, following the stages of the Energy Hierarchy, CHP and district heating has been assessed followed by a study of various low and zero carbon technologies. The graph below demonstrates the results for each stage of the Energy Hierarchy.

Figure 23: Overall CO_2 Emissions Reduction SAP 2012 Results



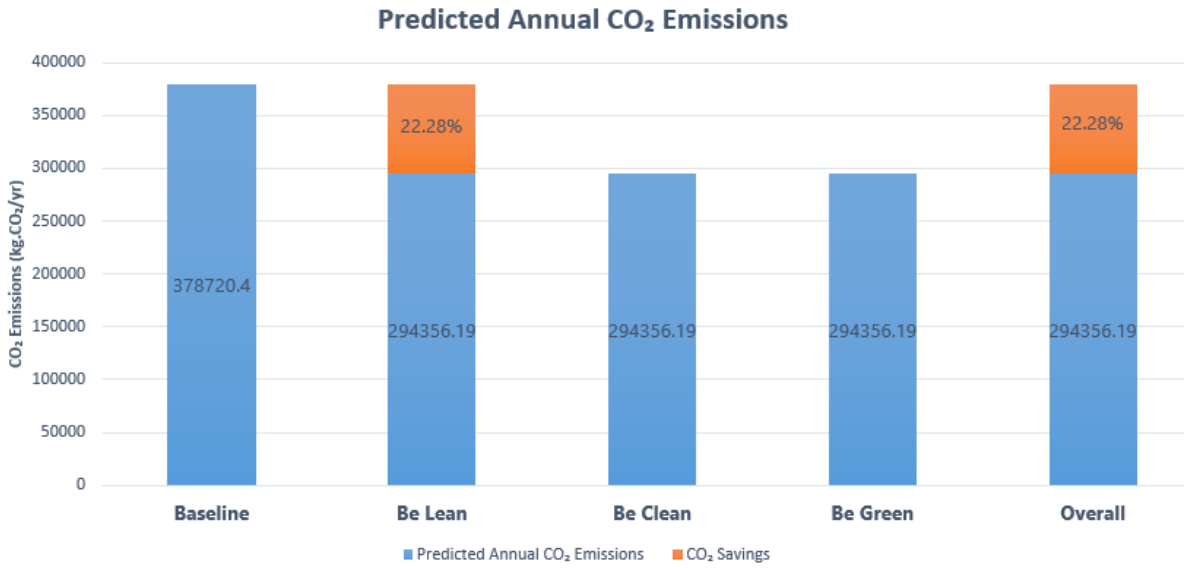


Figure 24: Overall CO_2 Emissions Reduction Estimated SAP 10 Results

A 22.28% overall reduction in CO_2 emissions can be observed. As stated previously, the Manchester Core Strategy requires a 15% improvement over Part L 2010 Building Regulations. These regulations have been superseded by 2013 and 2021 Building Regulations which collectively are a 37% betterment over 2010 Building Regulations by default. Therefore, by achieving a CO_2 reduction of 22.28% in the SAP 10 calculation graph above, this equates to a 59.28% improvement over 2010 Building Regulations and offers full compliance with the requirements of the Manchester Core Strategy.

Consideration has also been given to the RIBA 2030 Climate Challenge Targets with respect to domestic operational energy, embodied carbon and potable water use. Although RIBA plans on developing their targets further with UK professional bodies in order obtain concrete benchmarks; we have made every effort to reach the current baselines prescribed as we share RIBA's urgency and enthusiasm in addressing the current Environment and Climate Emergency.

To summarise, the SAP 10 estimated 22.28% reduction in CO_2 has been achieved using high-performance materials to improve the building fabric u-values, incorporating highly efficient air source heat pumps for heating/cooling and installing mechanical ventilation with heat recovery. Furthermore, low energy lighting will be used throughout, and low flow rate fixtures and fittings will be used to reduce water consumption. It is therefore the conclusion of this report that the requirements of Part L and the Manchester Core Strategy have been met whilst also supporting the RIBA 2030 Climate Challenge.

Heat gains from water heating, kWh/month 0.25 ´ [0.85 × (45)m + (61)m] + 0.8 x [(46)m + (57)m + (59)m]

(65)m=	77.68	69	73.72	67.83	67.74	62.35	61.61	65.22	64.36	70.26	72.09	76.4	(65)

include (57)m in calculation of (65)m only if cylinder is in the dwelling or hot water is from community heating

5. Internal gains (see Table 5 and 5a):

Metabolic gains (Table 5), Watts

	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec	
(66)m=	85.37	85.37	85.37	85.37	85.37	85.37	85.37	85.37	85.37	85.37	85.37	85.37	(66)

Lighting gains (calculated in Appendix L, equation L9 or L9a), also see Table 5

(67)m=	13.26	11.78	9.58	7.25	5.42	4.58	4.95	6.43	8.63	10.96	12.79	13.63	(67)

Appliances gains (calculated in Appendix L, equation L13 or L13a), also see Table 5

(68)m=	148.77	150.31	146.42	138.14	127.68	117.86	111.29	109.75	113.64	121.92	132.38	142.2	(68)

Cooking gains (calculated in Appendix L, equation L15 or L15a), also see Table 5

(69)m=	31.54	31.54	31.54	31.54	31.54	31.54	31.54	31.54	31.54	31.54	31.54	31.54	(69)

Pumps and fans gains (Table 5a)

(70)m=	3	3	3	3	3	3	3	3	3	3	3	3	(70)

Losses e.g. evaporation (negative values) (Table 5)

(71)m=	-68.3	-68.3	-68.3	-68.3	-68.3	-68.3	-68.3	-68.3	-68.3	-68.3	-68.3	-68.3	(71)

Water heating gains (Table 5)

(72)m=	104.4	102.68	99.09	94.22	91.05	86.59	82.81	87.66	89.38	94.43	100.13	102.68	(72)

Total internal gains = (66)m + (67)m + (68)m + (69)m + (70)m + (71)m + (72)m

(73)m=	318.04	316.38	306.7	291.22	275.77	260.64	250.66	255.45	263.27	278.92	296.9	310.13	(73)

6. Solar gains:

Solar gains are calculated using solar flux from Table 6a and associated equations to convert to the applicable orientation.
