Executive Summary

Appointment	In June 2021 Curtins were instructed by Mace Limited to undertake a Phase 1 Preliminary Risk Assessment of land off Land off Rodney Street, Ancoats, Manchester, M4 6JP. The site is centred on NGR SJ 85312 98957 and covers an area of approximately 0.63 Ha. It is understood that the site is to be redeveloped for a 6-8 storey residential block. At the time of writing, no proposed development plans were available.
Current Site Status	The site is currently occupied by an area of landscaping with grass cover, an area of hardstanding cover for car parking to the west, a pathway running from the western boundary through the centre of the site and mature trees along the western, southern and eastern boundaries. The site's topography is generally level.
Site History	Earliest mapping (1840's) shows the site as developed with rows of terraced housing with gardens and outhouses along Richmond Street, Leigh Street and William Street. By 1963, the site has re-developed after demolition of terraced residential dwellings and an unnamed works constructed in the north of the site. Industrial works and factories are developed surrounding the site up to 1969. Derwent residential building constructed in the south of the site by 1969 and new terraced residential properties in the north of the site. Major demolition off site and infilling of Rochdale Canal arms west of the site for new industrial estates and residential dwellings around the site by 1983. By 1999, Poland Street Industrial Estate is shown constructed on part of the recreation ground west of the site. Re-development of warehouses and works northeast of the site for new residential dwellings. All buildings on site demolished by 2006 and site is covered mainly by landscaping areas as today. Today, site is surrounded to the west by mix of landscaping areas, industrial estates to the west and southwest and residential estates to the east.
Geology	BGS mapping indicates the site is underlain by Glacial Till superficial deposits and bedrock geology of the Collyhurst Sandstone Formation. The BGS records a borehole log off-site (22m N) recorded Boulder Clay to 35.66m bgl (comprising bands of sand and gravels) overlying weathered bedrock of soft, friable, fine grained sandstone from 35.66m to 36.58m bgl. Site investigation by Curtins in 2019 at Jersey Street encountered Made Ground from surface level to 2.50m bgl overlying sandy gravelly clays and occasionally fine to coarse sand stratum to depths of 20.90m bgl. The site is located in a low probability radon area where <1% of homes are estimated to be at or above the radon Action Level.
Mining	The site is located within a Coal Mining reporting area. The site is not located within a Development High-Risk Area and there are no recorded mine entries, coal workings or probable coal workings within 500m of the site. The risk from shallow coal mining is therefore considered to be Low.
Hydrogeology	The site is underlain by a Secondary, undifferentiated, Aquifer associated with the superficial deposits and a Principal Aquifer (Collyhurst Formation). The site is not located within a Source Protection Zone (SPZ). There are no groundwater abstraction points within 500m of the site.
Hydrology	The nearest surface water feature is Rochdale Canal recorded 110m southeast of the site flowing east with River Quality B. There are no surface water abstractions within 1km. There are several discharge consents within 500m of the site, all relating to United Utilities stormwater overflow outages and treated effluent from a pumping station.
Unexploded Ordnance	Online UXO risk mapping identifies the site as being in a moderate-risk area. Due to no identified bomb-damaged areas within 150m of the site, risk from UXO is considered to be Low therefore no further action is required. If unexploded ordnance is discovered during any works, stop immediately, prevent access to the area, and inform the police. If the site boundary or location changes then the UXO risk should be reassessed.
Initial Ground Contamination Assessment	The risk from Made Ground posed to the site's end-users and groundwater is considered to be Moderate/Low taking into account the site's historical industrial land use and periods of redevelopment, but the lack of widespread industrial land use on site. The risk posed to surface water and groundwater receptors is considered to be Low due to lack of abstractions points within 500m and the thickness of low permeability superficial deposits underlying the site over the Principal Aquifer in Collyhurst Fm. The risk posed to site end-users from ground generating gases arising from Made Ground and demolition materials on the site is considered to be Moderate / Low accounting for the anticipated thicknesses of Made Ground soils underlying the site but anticipating low amounts of putrescible or organic content in the Made Ground soils.

Recommendations

The following recommendations are made with regards to further works at the site:

1. Undertake an intrusive ground investigation.
2. Undertake a GQRA as part of the ground investigation; and
3. Undertake Ground Gas Monitoring over a period of three months for methane, carbon dioxide, oxygen, hydrogen sulphide, gas flow in l/hr, weather conditions and barometric pressure (with confirmation if falling, steady or rising).

It is further recommended that this work is completed in advance of any development works taking place.

1.0 Introduction

1.1 Project Background

In June 2021 Curtins were instructed by Mace Limited to undertake a Phase 1 Preliminary Risk Assessment of land off Rodney Street, Ancoats, Manchester, M4 6JP.

The location and extent of the site is shown in *Figure 2.1*. It is understood that the site is to be redeveloped for a 6-8 storey residential block. At the time of writing, no proposed development plans were available.

1.2 Scope of Services

The Phase 1 Preliminary Risk Assessment (PRA) is intended to provide an overview of the geo-environmental and geotechnical setting of the site, prior to the proposed development of the site.

Through this overview, the Phase 1 PRA aims to develop both a working conceptual and ground model for the site, as well as present an initial assessment of any risks that could be presented to the development including its intended end users and the wider environment.

Specifically, the Phase 1 PRA provides an initial assessment of the site regarding:

- a) Potential on and offsite contamination from historical and/or current uses, including potential ground gas generating sources;
- b) The potential impact on the wider environment by historical and or current use of the site of interest;
- c) The potential impact from surrounding land uses and other environmental factors;
- d) Potential problems associated with geological features such as faulting, mineral extraction, mining and land instability; and
- e) The location of apparent sub-surface structures that may affect the proposed redevelopment.

Consideration of detailed flood risk, ecology and archaeological issues are outside of the scope of this report.

2.0 Current Site and Surrounding Area Details

2.1 Site Location and Current Details

Site use, location and description are shown below in *Table 2.1* and *Figure 2.1*.

Table 2.1 – Site Details

Site Address	Rodney Street, Ancoats, Manchester, M4 6JP.
NGR	SJ 85312 98957
Area of Site	Approximately 0.64 Ha
Current Site Use and Description	The site is currently occupied by mostly grass cover and landscaping areas with a small hardstanding area in the west for car parking and a pathway running from the boundary on Wadeford Close to the centre of the site. The western boundary is marked by Wadeford Close; the eastern boundary is marked by fencing west of Rodney Street. The northern boundary is marked by the car parking associated with Tribe Ancoats tower block. The south boundary is marked by Jersey Street. Metal fencing surrounds the site to the south and part of the western boundary and eastern boundary. The site is located in a predominantly residential area with Ancoats Green to the west and residential properties to the south and east. Oldham Road is approx. 70m to the north with some industrial businesses to the north. Industrial estates with more car parking areas are located southwest of the site and west of Ancoats Green. Rochdale Canal is 150m south of the site. The site's topography is relatively flat.

Figure 2.1 – Site Location Plan (site boundary shown in pink. 250m buffer in purple).

2.2 Surrounding Area Details

The following information was established through undertaking an environmental database search. The full Envirocheck report (Ref. 1) is included in *Appendix B*.

Table 2.2 – Surrounding Land Uses

Surrounding Area	N	Tribe Ancoats apartment block with associated car parking and soft landscaping; Oldham Road and industrial businesses beyond.
	E	Rodney Street, and residential dwellings and more park areas beyond.
	W	Ancoats Green, industrial estates and industrial businesses beyond.
	S	Jersey Street with residential dwellings and Rochdale Canal beyond.

3.0 Site History

A review of the available historical mapping and other information for the site, as presented within the Envirocheck Report (Ref. 1), has been undertaken and is presented in *Table 3.0* below.

Table 3.0 – Previous Site and Surrounding Area Uses and Potential Sources of Contamination. *Bold text refers to on-site activity.*

Date	Description	Potential Sources of Contamination
1848 – 1851	The site is developed. Rows of terraced housing with gardens and outhouses along Richmond Street, Leigh Street and William Street which are positioned through the site generally southwest to northeast. Manchester Glass Bottle Works is located west of the site. A church and church school are located southeast of the site and Rodney Street, Elizabeth Street and Butler Street cotton mills located further southeast (50-120m). The Rochdale Canal is located from 110m south, generally aligned southwest to northeast, with canal arms extending to the northwest, located approx. 70m west of the site. At this time, Shooter Brook was located approx. 150m south of the site. The Lancashire and Yorkshire railway line is located from 200m northwest, generally aligned southwest to northeast. Other industries in the local (within 250m) area include iron foundries, glass works, cotton mills, saw mills, tannery and coal wharfs. and other industrial works are located west of the canal.	• Limited potential for contamination and uncontrolled deposition of Made Ground on site from construction of properties on site. • Potential contamination and uncontrolled deposition of Made Ground from industrial land use within 100m off site.
1891 – 1938	The site remains unchanged. Manchester Glass Bottle Works re-developed with a recreation ground west of the site. The surrounding area is further developed with additional industrial land uses such as cotton mills, gas depot, corn mills and wharfs to the west. More terraced housing has been constructed from 150m north and 200m east. The area to the north between Oldham Rd and the railway line has been developed as a glass works and cable mills, with new railway sidings constructed related to the Goods Station and Potato Market from 130m northwest. Shooter Brook is no longer mapped by the 1890s.	• Uncontrolled deposition of made ground from demolition of industrial works off site. • Potential for contamination arising from industrial use of the wharfs within 100m west.
1948 – 1951	Demolition of terraced residential dwellings north and south of Flower Street (previously William Street) on site. Post WWII, local heavy industries such as cotton mills are replaced by clothing factories, warehouses and dyeing works, notably from 50m southwest. Rodney Street cotton mill now a dyeing works south of St Barnabus's Church and Sunday School. Demolition of residential properties northeast of the site and re-development as bag and rainwear factories and warehouse buildings. A ruin is mapped approx. 140m west. Redevelopment of residential properties in the surrounding area has occurred from 150m northeast.	• Uncontrolled deposition of Made Ground during demolition of terraced housing, with potential for back-filled basements. • Uncontrolled deposition of Made Ground during construction of new factory and warehouse buildings within 100m off site. • Potential for contamination from industrial works northeast and southeast of the site, within 100m.

Date	Description	Potential Sources of Contamination
1952 – 1963	Further demolition on site of terraced residential dwellings in south-eastern corner by 1952, with terraced properties demolished in the centre of the site by 1963. An unnamed works is also noted north of Leigh Street East in the north of the site. By 1953, a pub (beer house) is noted just north of the site. Arms of the Rochdale Canal west of the site have been cut off from the main canal channel south of the site By 1963, demolition of terraced residential dwellings directly east of the site, from 100m northeast and to the southeast with St Barnabus's Church demolished.	• Uncontrolled deposition of Made Ground during demolition of terraced housing, with potential for back-filled basements. • Potential for contamination arising from unnamed works on site. • Potential for gas generating soils from infilled canal arms west of the site.
1968 – 1988	Site completely re-developed by 1968; in the south demolition of residential properties and residential roads on site and construction of Derwent 'Home for Aged' with landscaped areas. In the north, row of new terraced housing or flats, aligned generally north-south with landscaped area to the east and an unnamed small building present in northwest of the site. Demolition of terraced residential properties north of the site and construction of Rodney Court apartment block and Butler Street by 1969. Canal arms west of the site infilled and depot constructed from 40m west. By 1983, re-development south of the site for new terraced housing and landscaping areas. Industrial works comprise the majority of land use west of the site. The Recreation Ground to the west has extended southwards during the late 1940s and again by the 1980s with a new large building constructed. To the northwest, the railway sidings, goods shed and potato warehouse are dismantled and demolished through the 1960s and 1970s.	• Uncontrolled deposition of Made Ground associated with demolition of terraced housing and historic streets, with potential for backfilled basements on site. • Uncontrolled deposition of Made Ground during construction of buildings on site. • Uncontrolled deposition of Made Ground from demolition and construction of new residential properties north and south of the site. • Potential for fuel/oil spills in hardstanding car park areas used around buildings on site. • Potential for contamination from industrial land use northeast, southeast and west of the site.
1992 – 2006	By 1992, demolition of small building by terraced housing in the north-western corner of the site. By 2006, demolition of Derwent building on southern area of site and re-developed with a landscaping area. By 1999, Poland Street Industrial Estate is marked on part of the recreation ground west of the site. Re-development of warehouses and works northeast of the site for new residential dwellings.	• Uncontrolled deposition of Made Ground associated with demolition of buildings on site. • Potential for fuel/oil spills in hardstanding areas used around depot buildings to the west. • Deposition of Made Ground associated with demolition of warehouses and construction of residential dwellings off site.
2006 – Present	Demolition of all buildings on site including terraced housing / apartments and all small buildings. Landscaped areas across the site and an old access road and area for car parking present in the west of the site. Redevelopment of the surrounding area continues.	• Uncontrolled deposition of Made Ground associated with demolition of terraced housing with potential for backfilled basements on site. • Potential for fuel/oil spills in hardstanding areas used for car parking.

Potential sources of onsite contamination are further discussed in *Section 6.0*.

4.0 Geology, Hydrogeology and Hydrology

4.1 Geology and Hydrogeology

A study of the Envirocheck (Ref. 1) Report and the British Geological Survey (BGS) 1:50,000 mapping records (Solid and Drift) for Manchester (Sheet 085) dated 2010 (Ref. 2) indicates the following geological and hydrogeological succession underlying the site:

Table 4.1 – Geological/Hydrogeological Succession

Geology	Associated Hydrogeological Classification
Glacial Till – Devensian, Diamicton ¹	Secondary Aquifer, Undifferentiated ²
Collyhurst Sandstone Formation – Sandstone ³	Principal Aquifer ⁴

Notes:

1. A heterogeneous mixture of clay, sand, gravel, and boulders varying widely in size and shape.
2. These layers have not been assigned an attribute either category A or B rock type due to not being possible. In most cases, this means that the layer in question has previously been designated as both minor and non-aquifer in different locations due to the variable characteristics of the rock type.
3. A soft red sandstone with abundant beds of "millet seed" sand grains alternating with beds of fine-grained sharp sand.
4. These are layers of rock or drift deposits that have high intergranular and/or fracture permeability - meaning they usually provide a high level of water storage. They may support water supply and/or river base flow on a strategic scale. In most cases, principal aquifers are aquifers previously designated as major aquifer.

Superficial deposits of Glacial Till are recorded across the site overlying the Collyhurst Sandstone Formation. There is a BGS recorded fault line directly west of the site within the Collyhurst Sandstone Formation aligned northwest-southeast with a downthrow to the west of the fault, with the Manchester Marls Formation recorded to the west and could potentially partially underlie the site.

There are four BGS borehole records (Ref. 3) are located within 100m of the site boundary. However, only one of these boreholes has the log accessible and it was advanced into bedrock. The relevant records are summarised in Table 4.2 below:

Table 4.2 – BGS Borehole Records

Record Reference	Location (NGR)	Details (bottom to top of strata/details/thickness of strata)	
SJ89NE190	Off Site 22m north (385287, 399031)	0.00m to 35.66m bgl	Boulder Clay: Many bands of sands and gravels (35.66m)
		35.66m to 36.58m bgl	Sandstone: Orange, soft, friable, fine grained. (0.91m)
		36.58m bgl	Borehole complete

BGS mapping records do not indicate the presence of Made Ground on site. Curtins conducted intrusive ground investigations in 2021 in three sites in the local area near Jersey Street (approximately 200m southwest of the site). The ground conditions are summarised below:

- Made Ground of variable composition was encountered from surface level to maximum depth of 2.50m bgl comprising generally coarse sands and gravels with ash, brick, concrete, and clinker content, overlying in some locations sandy gravelly clays.
- Made Ground was underlain by superficial deposits of Glacial Till to a maximum depth of 20.90m bgl comprising sandy gravelly clays with occasional bands of fine to coarse sand 2.10-3.50m thick.
- Weathered bedrock was encountered from 17.00-20.00m bgl, with competent bedrock of the Manchester Marls Formation encountered from 18.50-25.88m bgl.

It can be assumed from the available BGS borehole record, in *Table 4.2* and from the depth to bedrock encountered in boreholes advanced by Curtins to the southwest, that bedrock of the Collyhurst Sandstone Formation underlies the site at depths greater than 25.0m bgl.

The site is not situated within a Source Protection Zone (SPZ).

There are no groundwater abstraction points located within 1km of the site.

4.1.1 Mining

A review of the Coal Authority interactive mapping (Ref. 4) for the area indicates that the site is located within a Coal Mining Reporting Area, however it is not located within a Development High-Risk Area.

There are no recorded mine entries within 500m of the site.

There are no recorded coal workings and no probable coal workings within 500m of the site.

Consequently, the risk to development from historic coal mining is considered to be **Low**. No further actions are required to further assess the risk to development from historic coal mining.

There are no active or inactive BGS recorded mineral sites within 500m of the site.

4.1.2 Other Ground Stability Issues

The Envirocheck Report (Ref. 1) confirms that there is a no hazard to very low risk from the following ground stability hazards on the site; collapsible ground, compressible ground, ground dissolution, landslide ground, running sands, and shrinking or swelling clay.

4.1.3 Ground Gas

Given historic development and industrial land use on site and the details of the off-site BGS borehole records, it is likely that thicknesses of Made Ground and demolition material may be present on site. Given the thicknesses anticipated, these soils may act as a source of gas generation.

There are no BGS recorded landfill sites within 250m of the site. There are no historical landfill sites recorded within 500m of the site.

There are five potentially infilled water features within 250m of the site; the nearest being 78m southwest of the site related to the back-filled canal arms which are potential gas generating features within influencing distance of the site.

The Envirocheck Report (Ref. 1) and BGS Radon Mapping (Ref. 5) confirms the site is situated in an area where <1% of homes are above the radon action level. Radon protection measures are therefore not considered necessary within the proposed development. However, where the new development incorporates a basement the advice of a specialist Radon assessor must be obtained.

4.2 Hydrology

The nearest surface water feature identified by the Envirocheck report (Ref.1) is 110m to the southeast which is the Rochdale Canal and is categorised as River Quality B.

There are no recorded pollution incidents to controlled waters in the past 20 years within 1km of the site.

There are two surface water abstractions within 1km, the nearest being 560m east of the site from Ashton Canal used for industrial, commercial or public service use. There are no potable surface water abstraction points within 1km.

There are four discharge consents within 250m of the site, all relating to either storm sewage overflow tank outages or final treated effluent from a United Utilities pumping station.

5.0 Unexploded Ordnance Risk Assessment

Military activities including those conducted as part of both the First and Second World Wars have resulted in a legacy of unexploded ordnance (UXO) being present within the shallow soils of the UK.

UXO result from various sources including both allied (military training) and German (bombing raids) with a guide figure of approximately 10% of all munitions failing to function as designed.

The likelihood of UXO being encountered on a development site is influenced by several factors including; the proximity to strategic targets, the nature of the development works being undertaken and evidence of local damage in the post-war periods amongst others. To determine the likelihood of UXO being present on a site, a step-wise risk assessment process is followed. This process is outlined within CIRIA C681 Unexploded Ordnance: A Guide for the Construction Industry (Ref. 6) with the following commentary considered to represent a Preliminary Risk Assessment intended to guide if and where there is a requirement for a Detailed Risk Assessment.

5.1 Preliminary UXO Assessment

Risk mapping (Ref. 7) for UXO's has placed the site in a **Moderate** risk area. Moderate-risk regions are those with a bombing density of less than 15 to 50 bombs per 1000 acres.

A review of the available historic mapping did not identify the presence any ruins or features indicative of bomb damage following WWII within 100m of the site boundary.

A review of available online bomb damage mapping for Manchester (Ref. 8) shows bombing damage from 150m west and 150m northeast. No bombs were recorded on or close to the site, as shown below.

Figure 5.1 – Site boundary shown in pink. Red circles indicate high explosive bomb hits, blue circles indicate firebomb hits, pink shading for damaged buildings, red shading for demolished buildings.

Considering the above and that the site was occupied throughout WWII and has been re-developed since the 1950's so any UXO on site would have likely been encountered, the risk of encountering potential UXO as part of future intrusive works is considered **Low**, and no further action is required.

If unexploded ordnance is discovered during any works, stop immediately, prevent access to the area, and inform the police. If the site boundary or location changes then the UXO risk should be reassessed.

6.0 Conceptual Site Model & Qualitative Risk Assessment

The conceptual site model (CSM) and Qualitative Risk Assessment (QRA) are presented in the table within this section.

The CSM details the source-pathway-receptor linkages or potential pollutant linkages (PPL) that have been identified for the site. The QRA details the associated level of risk relating to these potential pollutant linkages.

The CSM and QRA concern risk to human health and water environment with additional, more specific risk assessment protocols contained within the main body of this reporting, as detailed in *Section 6.1* below.

The QRA follows the framework outlined within CIRIA C552 (Ref. 9) which is summarised within *Appendix C*.

The 'risk rating' within the QRA refers to the risk that the source, pathway, receptor linkage or PPL is complete. Unless specifically stated it does not necessarily refer to an immediate risk and is intended to be used as a tool to assess the necessity for further assessment/investigation.

6.1 Additional Risk Assessments

The following risk assessments, listed below, are not included within the main CSM and QRA but nonetheless can be of critical importance to the onward development of the site:

- The risk presented by Mining is discussed and assessed in *Section 4.1.1*.
- The risk presented by Radon is discussed and assessed in *Section 4.1.3*.
- The risk presented by Unexploded Ordnance is discussed and assessed in *Section 5.0*.

Under current health and safety legislation, employers are required to carry out their own appropriate risk assessments and mitigation to protect themselves and their employees, other human receptors and the environment from potential contamination. Such risks must be adequately mitigated by law, specifically the Construction Design Management (CDM) Regulations, 2015 (Ref. 10) which require that potential risks to human health and the environment from construction activities are appropriately identified and all necessary steps taken to eliminate / manage that risk. It has been assumed that any future construction works on site will be undertaken in compliance with these requirements.

Qualitative Risk Assessment
Generic Quantitative Risk Assessment
Detailed Quantitative Risk Assessment or; Remedial Action

- The table below represents the first stage in the land quality risk assessment process: The Qualitative Risk Assessment.
- For a development site to be deemed 'suitable for use', the level of risk needs to be brought down to acceptable levels, i.e. low to very low risk. The purpose of each stage of risk assessment is ultimately to establish, if there is a requirement for additional levels of assessment to be made to have sufficient confidence to support a risk characterisation or management decision, e.g. remedial action.
- In the absence of specific site data, a Generic Quantitative Risk Assessment is invariably recommended.

Conceptual Site Model			Qualitative Risk Assessment			Recommended Actions
Source	Pathway(s)	Receptor(s)	Consequence	Likelihood of Occurrence	Risk Rating	
Significant sources of on-site contamination: • Made Ground of unknown composition from uncontrolled deposition of materials associated with previous phases of development including construction and demolition of the terraced residential dwellings and possible associated basements, unnamed works in northern area of site, including asbestos from buildings demolished pre-2000. • Potential for contamination arising from historic industrial land use of the site associated with the unnamed works. • Potential for contaminants associated with the site's use (in hardstanding areas) as a car park including potential for fuels and oil leaks/spills.	Direct contact, ingestion, inhalation (dust and vapours)	End-user of site (Residential property end-users) & Construction Workers	Medium Chronic health risk	Low Likelihood Based on the site's historical use as terraced residential housing with streets and an unnamed works in the northern area, then redeveloped as a Home and more terraced properties with parking, the likelihood of encountering significant contamination in the Made Ground is considered to be low. However localised areas of contamination cannot be discounted. Likelihood of construction workers coming into contact with contamination on site can be reduced by appropriate PPE.	Moderate / Low	Generic Quantitative Risk Assessment Recommended as part of the ground investigation.
	Vertical migration through the superficial deposits (soils) May occur due to existing service corridors and physical processes including: capillary action and downwards flow into the natural deposits through infiltration.	Controlled Waters (Groundwater) Principal Aquifer (Collyhurst Fm) overlain by Glacial Till (Secondary Undifferentiated Aquifer). There are no groundwater abstraction points within 1km. The site is not within a designated Source Protection Zone.	Medium Pollution of sensitive water resources	Unlikely Taking into account the lack of SPZ and potable abstractions points within 1km, and the thickness of low permeability clay overlying the bedrock (>10m), it is considered unlikely that contamination in soils would negatively impact the Principal Aquifer.	Low	No further action required unless gross contamination identified in site soils in GI.
	Horizontal migration over and through the superficial deposits (soils)	Controlled Waters (Surface Water) Nearest surface water feature is the Rochdale Cana (River Quality B) located 110m southeast of the site. No surface water abstraction points within 500m.	Medium Pollution of sensitive water resources	Unlikely Considering the distance from the site to the nearest sensitive surface water receptor and lack of abstractions points within 500m, this pathway is considered unlikely.	Low	No further action required
Significant sources of off-site contamination: • Uncontrolled deposition of Made Ground during the construction of new roads, residential dwellings and industrial land use adjacent to the site's boundaries. • Local (within 100m) industrial land use included mills, foundries, glass works, warehouses, factories, depots and dyeing works.						
Significant sources of ground gas: • Potential for organic or putrescible soils • Potential for unknown thickness of Made Ground and demolition material on site. • Infilled water features (canal arms) within 250m of the site boundary.	Vertical and horizontal migration through existing service corridors and the underlying superficial deposits	End-user of site (Residential property end-users)	Medium Human health risk	Low Likelihood Unknown thickness of made ground present, but taking into account that made ground soils are likely predominantly low in putrescible material reflecting construction and demolition material	Moderate / Low	Generic Quantitative Risk Assessment Recommended as part of the ground investigation.

7.0 Conclusion and Recommendations

The qualitative risk assessment (QRA) determined a varied level of level of risk associated with the proposed development.

The QRA concluded by recommending that generic quantitative risk assessments (GQRA) were conducted to confirm the assessment of risk ascribed to each of the respective potential pollutant linkages (PPLs). It is recommended that the GQRA is conducted as part of a ground investigation in support of the engineering design of the proposed development.

In summary, the following recommendations are made:

- Undertake an intrusive ground investigation;
- Undertake a GQRA as part of the ground investigation; and
- Undertake ground gas monitoring over a period of three months for potential hazardous gases.

It is further recommended that the site investigation works are completed in advance of any development works taking place.

7.1 Contaminants of Concern

Potential contaminants of concern associated with the sources identified within the Conceptual Site Model in *Section 6.0* of this reporting include but are not limited to: broad range aliphatic and aromatic hydrocarbons present within any fuel oils; polycyclic aromatic hydrocarbons (PAHs); inorganic compounds including heavy metals; and asbestos present in discarded building materials.

Potential contaminants associated with airborne dust/particulates include but are not limited to: polycyclic aromatic hydrocarbons and inorganic compounds including toxic metals that are also accounted for by potential onsite contaminants of concern.

7.2 Other Considerations

The requirement for additional surveys, e.g. arboricultural and ecological surveys, should be confirmed through advice from a suitably qualified and experienced professional.

Introduction

The Environment Act 1995 has made site sensitivity a key issue, as the legislation pays as much attention to the pathways by which contamination could spread, and to the vulnerable targets of contamination, as it does the potential sources of contamination. For this reason, Landmark's Site Sensitivity maps and Datasheet(s) place great emphasis on statutory data provided by the Environment Agency/Natural Resources Wales and the Scottish Environment Protection Agency; it also incorporates data from Natural England (and the Scottish and Welsh equivalents) and Local Authorities; and highlights hydrogeological features required by environmental and geotechnical consultants. It does not include any information concerning past uses of land. The datasheet is produced by querying the Landmark database to a distance defined by the client from a site boundary provided by the client. In this datasheet the National Grid References (NGRs) are rounded to the nearest 10m in accordance with Landmark's agreements with a number of Data Suppliers.

Index Map

For ease of identification, your site and buffer have been split into Slices, Segments and Quadrants. These are illustrated on the Index Map opposite and explained further below.

Slice
Each slice represents a 1:10,000 plot area (2.7km x 2.7km) for your site and buffer. A large site and buffer may be made up of several slices (represented by a red outline), that are referenced by letters of the alphabet, starting from the bottom left corner of the slice "grid". This grid does not relate to National Grid lines but is designed to give best fit over the site and buffer.

Segment
A segment represents a 1:2,500 plot area. Segments that have plot files associated with them are shown in dark green, others in light blue. These are numbered from the bottom left hand corner within each slice.

Quadrant
A quadrant is a quarter of a segment. These are labelled as NW, NE, SW, SE and are referenced in the datasheet to allow features to be quickly located on plots. Therefore a feature that has a quadrant reference of A7NW will be in Slice A, Segment 7 and the NW Quadrant.

Geology 1:50,000 Maps

This report contains geological map extracts taken from the BGS Digital Geological map of Great Britain at 1:50,000 scale and is designed for users carrying out preliminary site assessments who require geological maps for the area around the site. This mapping may be more up to date than previously published paper maps.

The various geological layers - artificial and landslip deposits, superficial geology and solid (bedrock) geology are displayed in separate maps, but superimposed on the final 'Combined Surface Geology' map. All map legends feature on this page. Not all layers have complete nationwide coverage, so availability of data for relevant map sheets is indicated below.

Artificial Ground and Landslip

Artificial ground is a term used by BGS for those areas where the ground surface has been significantly modified by human activity. Information about previously developed ground is especially important, as it is often associated with potentially contaminated material, unpredictable engineering conditions and unstable ground.

Artificial ground includes:

- Made ground - man-made deposits such as embankments and spoil heaps on the natural ground surface.
- Worked ground - areas where the ground has been cut away such as quarries and road cuttings.
- Infilled ground - areas where the ground has been cut away then wholly or partially backfilled.
- Landscaped ground - areas where the surface has been reshaped.
- Disturbed ground - areas of ill-defined shallow or near surface mineral workings where it is impracticable to map made and worked ground separately.

Mass movement (landslip) deposits on BGS geological maps are primarily superficial deposits that have moved down slope under gravity to form landslips. These affect bedrock, other superficial deposits and artificial ground. The dataset also includes foundered strata, where the ground has collapsed due to subsidence.

Superficial Geology

Superficial Deposits are the youngest geological deposits formed during the most recent period of geological time, the Quaternary, which extends back about 1.8 million years from the present.

They rest on older deposits or rocks referred to as Bedrock. This dataset contains Superficial deposits that are of natural origin and 'in place'. Other superficial strata may be held in the Mass Movement dataset where they have been moved, or in the Artificial Ground dataset where they are of man-made origin.

Most of these Superficial deposits are unconsolidated sediments such as gravel, sand, silt and clay, and onshore they form relatively thin, often discontinuous patches or larger spreads.

Bedrock and Faults

Bedrock geology is a term used for the main mass of rocks forming the Earth and are present everywhere, whether exposed at the surface in outcrops or concealed beneath superficial deposits or water.

The bedrock has formed over vast lengths of geological time ranging from ancient and highly altered rocks of the Proterozoic, some 2500 million years ago, or older, up to the relatively young Pliocene, 1.8 million years ago.

The bedrock geology includes many lithologies, often classified into three types based on origin: igneous, metamorphic and sedimentary.

The BGS Faults and Rock Segments dataset includes geological faults (e.g. normal, thrust), and thin beds mapped as lines (e.g. coal seam, gypsum bed). Some of these are linked to other particular 1:50,000 Geology datasets, for example, coal seams are part of the bedrock sequence, most faults and mineral veins primarily affect the bedrock but cut across the strata and post date its deposition.

Combined Surface Geology

The Combined Surface Geology map combines all the previous maps into one combined geological overview of your site.

Please consult the legends to the previous maps to interpret the Combined "Surface Geology" map.

Additional Information

More information on 1:50,000 Geological mapping and explanations of rock classifications can be found on the BGS website. Using the LEX Codes in this report, further descriptions of rock types can be obtained by interrogating the 'BGS Lexicon of Named Rock Units'. This database can be accessed by following the 'Information and Data' link on the BGS website.

Lancashire And Furness

Published 1848

Source map scale - 1:10,560

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840's. In 1854 the 1:2,500 scale was adopted for mapping urban areas; these maps were used to update the 1:10,560 maps. The published date given therefore is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas. In the late 1940's, a Provisional Edition was produced, which updated the 1:10,560 mapping from a number of sources. The maps appear unfinished - with all military camps and other strategic sites removed. These maps were initially overprinted with the National Grid. In 1970, the first 1:10,000 maps were produced using the Transverse Mercator Projection. The revision process continued until recently, with new editions appearing every 10 years or so for urban areas.

Ordnance Survey Plan

Published 1966 - 1968

Source map scale - 1:10,000

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840's. In 1854 the 1:2,500 scale was adopted for mapping urban areas; these maps were used to update the 1:10,560 maps. The published date given therefore is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas. In the late 1940's, a Provisional Edition was produced, which updated the 1:10,560 mapping from a number of sources. The maps appear unfinished - with all military camps and other strategic sites removed. These maps were initially overprinted with the National Grid. In 1970, the first 1:10,000 maps were produced using the Transverse Mercator Projection. The revision process continued until recently, with new editions appearing every 10 years or so for urban areas.

Manchester

Published 1975

Source map scale - 1:25,000

These maps were produced by the Russian military during the Cold War between 1950 and 1997, and cover 103 towns and cities throughout the U.K. The maps are produced at 1:25,000, 1:10,000 and 1:5,000 scale, and show detailed land use, with colour-coded areas for development, green areas, and non-developed areas. Buildings are coloured black and important building uses (such as hospitals, post offices, factories etc.) are numbered, with a numbered key describing their use. They were produced by the Russians for the benefit of navigation, as well as strategic military sites and transport hubs, for use if they were to have invaded the U.K. The detailed information provided indicates that the areas were surveyed using land-based personnel, on the ground, in the cities that are mapped.

10k Raster Mapping

Published 1999

Source map scale - 1:10,000

The historical maps shown were produced from the Ordnance Survey's 1:10,000 colour raster mapping. These maps are derived from Landplan which replaced the old 1:10,000 maps originally published in 1970. The data is highly detailed showing buildings, fences and field boundaries as well as all roads, tracks and paths. Road names are also included together with the relevant road number and classification. Boundary information depiction includes county, unitary authority, district, civil parish and constituency.

VectorMap Local
Published 2021
Source map scale - 1:10,000
VectorMap Local (Raster) is Ordnance Survey's highest detailed 'backdrop' mapping product. These maps are produced from OS's VectorMap Local, a simple vector dataset at a nominal scale of 1:10,000, covering the whole of Great Britain, that has been designed for creating graphical mapping. OS VectorMap Local is derived from large-scale information surveyed at 1:1250 scale (covering major towns and cities), 1:2500 scale (smaller towns, villages and developed rural areas), and 1:10 000 scale (mountain, moorland and river estuary areas).

Source map scale - 1:2,500

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840's. In 1854 the 1:2,500 scale was adopted for mapping urban areas and by 1896 it covered the whole of what were considered to be the cultivated parts of Great Britain. The published date given below is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas.

Supply of Unpublished Survey Information

Published 1973

Source map scale - 1:1,250

SUSI maps (Supply of Unpublished Survey Information) were produced between 1972 and 1977, mainly for internal use at Ordnance Survey. These were more of a 'work-in-progress' plan as they showed updates of individual areas on a map. These maps were unpublished, and they do not represent a single moment in time. They were produced at both 1:2,500 and 1:1,250 scales.

Lancashire And Furness

Published 1850 - 1851

Source map scale - 1:1,056

The 1:1056 scale of Ordnance Survey mapping was adopted from Ireland in 1848 and was used to survey towns with a population of over 4000, plus county towns of lesser population, in those counties mapped at the six-inch scale in 1841-55. The scale was the largest scale at which London was mapped by the Ordnance Survey and a 'skeleton' survey of the capital, showing little more than streets, street names, frontages and altitudes, was undertaken between 1848 and 1850. The majority of the 1:1056 surveys were later replaced by 1:500 surveys; although almost all the remainder were revised at this scale, sometimes more than once before 1895. The type of detail shown on the 1:1056 scale is broadly similar to that on 1:500; the apparent omission of minor details such as sewer access points and street lights may be as much a reflection of the generally earlier date of these plans, as of the specification of the map.

Please note: Due to the partial coverage of Historical Town Plans, it is possible that not all segments within an order will contain mapping. Only the segments that have Town Plan coverage will be generated.

Lancashire And Furness

Published 1891

Source map scale - 1:500

The 1:500 scale Ordnance Survey mapping was introduced in 1855 as a replacement for the 1:528 scale and to complement the 1:2500 scale that had been implemented in 1853. By 1895, the 1:500 scale covered most towns over a population of about 4000 at the time of survey, although very few towns were mapped more than once at this scale, and none have been since 1910. The 1:500 scale gives particular emphasis to such features as lamp posts, man holes, arched passages and minor building projections. Also often featured are divisions between tenements, interior ground floor layouts of public buildings, and on earlier plans, the functions of the various parts of larger industrial premises are also indicated. Content of the plans does vary however, from one town to the next in terms of, for example, the completeness of railway tracks and the coverage of public buildings.

Please note: Due to the partial coverage of Historical Town Plans, it is possible that not all segments within an order will contain mapping. Only the segments that have Town Plan coverage will be generated.

Appendix C Qualitative Risk Assessment Rationale

The site-specific risk assessment, presented in this report, follows the principle of establishing whether there is a viable linkage between a contaminant source to a potential receptor, via an exposure pathway.

The risk assessment corresponds with the total site area and incorporates both descriptive (qualitative) and, where available, numerical (quantitative) lines of evidence.

Risk assessment is the process of collating known information on a hazard or set of hazards to estimate actual or potential risk to receptors. The receptor may be humans, a water resource, a sensitive local ecosystem or future construction materials. Receptors can be connected to the source by one or several exposure pathways such as direct contact for example. Risks are generally managed by isolating the receptor or intercepting the exposure pathway or by isolating or removing the hazard.

Without the three essential components of a source, pathway and receptor there can be no risk. Therefore, the presence of contaminant source on a site does not necessarily mean there is a risk.

The risk assessment considers the likelihood of an event taking place (accounting for the presence of the source and receptor and the viability of the exposure pathway) in conjunction with the severity of the potential consequence (accounting for the potential severity of the hazard and the sensitivity of the receptor).

In the risk assessment, the consequence of the hazard has been classified as severe or medium or mild or minor and the probability (likelihood) of the circumstances occurring classified as high likelihood or likely or low likelihood or unlikely.

The consequences and probabilities are subsequently cross-correlated to give a qualitative estimation of the risk using Department of the Environment risk classifications as detailed in the table below and as referenced in CIRIA C552.

		Consequence			
		Severe	Medium	Mild	Minor
Probability (Likelihood)	High Likelihood	Very High Risk	High Risk	Moderate Risk	Moderate/Low Risk
	Likely	High Risk	Moderate Risk	Moderate/Low Risk	Low Risk
	Low Likelihood	Moderate Risk	Moderate/Low Risk	Low Risk	Very Low Risk
	Unlikely	Moderate/Low Risk	Low Risk	Very Low Risk	Very Low Risk

In accordance with DoE guidance, the following categorisation of **consequence** has been developed.

Classification	Definition	Examples
Severe	Short-term (acute) risk to human health likely to result in "significant harm" as defined by the Environment Protection Act 1990, Part IIA. Short-term risk of pollution of sensitive water resource. Catastrophic damage to buildings/property. A short-term risk to an ecosystem or organisation forming part of such ecosystem.	High concentrations of cyanide on the surface of an informal recreation area. Major spillage of contaminants from site into controlled water. Explosion, causing building collapse (can also equate to a short-term human health risk if buildings are occupied).
Medium	Chronic damage to Human Health. Pollution of sensitive water resources. A significant change in an ecosystem or organism forming part of such ecosystem.	Concentration of a contaminant from site exceeds the generic or site-specific assessment criteria. Leaching of contaminants from a site to a Principal or Secondary A aquifer. Death of a species within a designated nature reserve. Lesser toxic and asphyxiate effects
Mild	Pollution of non-sensitive water resources. Significant damage to crops, buildings, structures and services. Damage to sensitive buildings/structures/services or the environment.	Pollution of non-classified groundwater (inc. Secondary B aquifers). Damage to building rendering it unsafe to occupy (e.g. foundation damage resulting in instability).
Minor	Harm, although not necessarily significant harm, which may result in a financial loss or expenditure to resolve. Non-permanent health effects to human health (easily prevented by means such as personal protective clothing, etc). Easily repairable effects of damage to buildings, structures and services.	The presence of contaminants at such concentrations that protective equipment is required during site works. The loss of plants in a landscaping scheme. Discoloration of concrete.

In accordance with DoE guidance, the following categorisation of **probability** has been developed.

Classification	Definition
High Likelihood	There is a pollution linkage and an event that either appears very likely in the short term and almost inevitable over the long term or there is evidence at the receptor of harm or pollution.
Likely	There is a pollution linkage and all the elements are present and in the right place, which means that it is probable that an event will occur. Circumstances are such that an event is not inevitable, but possible in the short term and likely over the long term.
Low Likelihood	There is a pollution linkage and circumstances are possible under which an event could occur. However, it is by no means certain that even over a longer period such event would take place and is less likely in the shorter term.
Unlikely	There is a pollution linkage, but circumstances are such that it is improbable that an event would occur even in the very long term.

In accordance with DoE guidance, the following categorisation of **risk** has been developed.

Classification	Definition
Very High Risk	There is a <i>high probability</i> that <i>severe harm</i> could arise to a designated receptor from an identified hazard at the site without appropriate further action.
High Risk	<i>Harm is likely to arise</i> to a designated receptor from an identified hazard at the site without appropriate further action.
Moderate Risk	<i>It is possible</i> that without appropriate further action <i>harm could arise</i> to a designated receptor. It is relatively <i>unlikely</i> that any such harm would be <i>severe</i> , and if any harm were to occur it is <i>more likely</i> that such harm would be <i>relatively mild</i> .
Low Risk	<i>It is possible</i> that <i>harm could arise</i> to a designated receptor from an identified hazard. It is <i>likely</i> that, at worst, if any harm was realised any effects would be <i>mild</i> .
Very Low Risk	The presence of an identified hazard does not give rise to the potential to cause harm to a designated receptor.

The term 'risk' in this instance refers to the risk that the source, pathway, receptor linkage for a given source of contamination is complete. It does not refer to immediate risk to individuals or features present on the site from potential contaminants and is intended to be used as a tool to assess the necessity of further investigation.
