1 EXECUTIVE SUMMARY

Site Details	The site is a brownfield site located in the north west corner of the larger Suez recycling facility. The development proposals are for the redevelopment of the Household Waste Recycling Centre making the process more efficient for users and Suez.
Current site Use and Description	The site is currently in use as a HWRC and has been since the early 1980's. The site consists of a one way trafficked road allowing customers to dispose of household waste, the centre contains numerous bins for the disposal of this waste.
Site NGR	SD880010
Surrounding Land Use	Surrounding the site to the east and south is the additional areas of the Suez recycling facility. To the north is green space with Moston Brook in the centre. To the west is Reliance Street with residential dwellings beyond.
Site History	The site begins as agricultural land in 1893. From 1908 to 1975 – 1976 there are residential dwellings present. 1977 – 1978 shows the site becoming part of a Timber Yard and a 'refuse destructor' becomes present from 1980. The site is only being used for access at this point with the current layout first appearing in circa 1983.
Geology	British Geological Survey (BGS) maps indicate that the site has a bedrock of Collyhurst Sandstone Formation and superficial deposits of Till, Devensian – Diamicton. BGS borehole records show large depths of made ground surrounding the site.
Hydrogeology	The site is within a nitrate vulnerable zone – groundwater and surface water. The site is not beneath a recorded source protection zone. Principal (bedrock) aquifer and secondary A undifferentiated (superficial) aquifer. Groundwater vulnerability map shows medium-low vulnerability.
Hydrology	No main watercourses run through or adjacent to the site. The nearest watercourse, Moston Brook is located approximately 75m north of the site.
Regulatory Enquires	This report utilises information from the EA, DEFRA, Landmark Information Group, online maps and the local planning authority (Manchester City Council).
Site Investigation	Infiltration testing to BRE365 has not been undertaken due to the presence of large depths of made ground previously discovered during SI.

Conclusions

A Phase 1 Contaminated Land Survey has been undertaken which identified that from most sources there is limited potential for contamination resulting from the historic site use, current use or from the surrounding area.

The risk of contamination to groundwater is considered to be low.

It is recommended that if evidence of contamination is found during construction that testing is undertaken and, if necessary, mitigation measures are undertaken. The potential presence of asbestos will require further investigation prior to demolition/construction.

2 INTRODUCTION AND METHODOLOGY

2.1 Introduction

A Phase 1 Contaminated Land Survey has been undertaken which identified that from most sources there is limited potential for contamination resulting from the historic site use, current use or from the surrounding area.

The risk of contamination to groundwater is considered to be low.

It is recommended that if evidence of contamination is found during construction that testing is undertaken and, if necessary, mitigation measures are undertaken. The potential presence of asbestos will require further investigation prior to demolition/construction.

2.2 Scope of Works

This Contaminated Land Assessment has been designed to provide information relating to:

- The current and former land uses of the site and the surrounding area;
- Comment will be made regarding the environmental sensitivity of the site location based on the following factors: geology, hydrogeology, surface watercourses and neighbouring land uses; and
- Records held by environmental regulators.

Information provided by the client has been reviewed and incorporated into the report when considered relevant to the contaminated land assessment

3 LAND USE

3.1 Site Details

The proposed site area is approximately 0.6ha. The site is located in the north-western corner of the larger Suez Recycling plant. The proposed redevelopment area is in the north-western corner of Suez ownership, centred on NGR: SD880010. Access to the site is from Reliance Street.

Figure 1: Site Location Plan

Plans of the proposed development are available in Appendix A of this report.

The remaining Suez recycling plant area is located immediately from the eastern boundary to the southern boundary. Reliance Street forms the immediate western boundary. To the north is an area of vegetation and Moston Brook, a watercourse.

Beyond the immediate surrounds, there are residential dwellings to the north, a dealership specialising in spare car parts to the east, railway line and other industrial/commercial units to the south and residential dwellings/Newton Heath Train depot to the west.

Other than the previously mentioned there are no other notable land uses surrounding the site.

3.2 Site Reconnaissance

A site walk-over was undertaken on 18 April 2021. A summary of the key walk-over observations can be seen below:

Specific on-Site Activities

The site is currently used as a household waste recycling centre with a one-way trafficked system and in only and out only access arrangement. Vehicles drive around in a clockwise direction with bins to dispose of waste located on the northern boundary and in the centre of the site.

Bulk Fuel Storage

There are no tanks onsite for the storage of fuel.

Drainage

The site is predominantly impermeable and currently benefits from a formal surface water drainage network. Included within this network is an emergency shut off valve in case of a spillage of potentially contaminated material that is likely to enter the drainage network.

Asbestos Containing Materials

There are no obvious signs of asbestos within the site, and the disposal of asbestos is not permitted at the site. There may be a risk of asbestos being in the cement used for the existing retaining wall to the south.

3.3 Former Land Uses

A study of historical Ordnance Survey maps, the sites planning history and local history records has been completed to identify former land uses that may have introduced contaminants into the site area.

The Envirocheck information contained within Appendix B shows that the site used to be residential until the 1970's when the land was then used as the access for the timber yard/recycling centre.

Table 1 below provides a summary of the historic land uses within the site boundary and relevant information about the surrounding area.

Site Features	Dates
Agricultural use	Prior to 1848 – 1895
Residential use – Buildings and gardens	Prior to 1909 - 1975
Timber Yard – Expanded into site boundary	Prior to 1975
Recycling Centre	Prior to 1990 – Present
Wider Site Area Features	
Railway Station – To the South	1894
Timber Yard – To the Southeast	1956

Table 1: Site Information Based on Maps and Anecdotal Information

Planning History

The site has been present since the 1980's with no significant changes and no planning permissions sought since opening. There have been a couple of planning permissions sought and granted at the main Suez site immediately south, but these do not affect the HWRC.

3.4 Regulatory Information and Consultation

Table 2 below provides a summary of the regulatory information available for the site and the surrounding area from the Envirocheck report (Appendix B).

Regulatory Authorities	On Site	0-250m	Details
Environment Agency Records			
Registered landfill or other waste disposal sites	(1)	1, (3)	Registered Landfill site, (Historic Landfill sites)
Pollution Incidents	0	2	Both Minor - Pollutants: Plaster & Plasterboard and Miscellaneous – Natural
Registered waste transfer or treatment sites	0	4	Scrap Yard, Treatment, Pulverization - with transfer and Pulverization
Authorised industrial processes (integrated pollution control)	0	0	N/A
Radioactive substance licences	0	0	N/A
Local Authority Records			
Authorised industrial processes	0	13	Active industrial processes including - Waste Disposal Services, Wire Products, Garage Services, Food Products, Car body repairs and car painters & sprayers, Car Breakers & Dismantlers, Commercial Vehicle Manufacturers, Petrol Filling Stations, Engineers – General
Pollution Prevention & Controls	0	6	Disposal of non-hazardous waste
Private Water Supplies	0	7	
Other Information Sources	Yes/No		Details
Coal Authority Records			
Is the site in a known area affected by past, current or future underground or surface coal mining?	Yes		Inconclusive Coal Mining, Hazard Potential – Very Low
Miscellaneous			
Is the site in an area where there is a known risk of flooding?	Yes		BGS groundwater flooding susceptibility
Are there any overhead transmission lines, masts or pylons for electricity within 250 metres of the site?	Yes		Yes the train line with in 250m has overhead lines
Is the site in a Nitrate Vulnerable Zone	Yes		Surface Water – River Irk

Table 2: Regulatory Information

3.5 Land Use Summary

The land use of the site has been agricultural before 1848-1895. The western side of the site had residential terraced housing constructed before 1909 and demolished before 1975, to accommodate the expansion of a timber yard. This was then converted into a recycling centre sometime before 1990 and is still operating presently. The whole site area is covered by hardstanding. Local authorised industrial processes currently active include; Waste Disposal Services, Wire Products, Garage Services, Food Products, Car body repairs and car painters & sprayers, Car Breakers & Dismantlers, Commercial Vehicle Manufacturers, Petrol Filling Stations and Engineers – General, within 250m of the site. The site has historic use as a landfill site and currently operates as a waste disposal site.

4 ENVIRONMENTAL SETTING

4.1 Geological / Hydrogeology

British Geological Survey (BGS) maps indicate that the site has a bedrock of Collyhurst Sandstone Formation over superficial deposits of Till, Devensian – Diamicton. BGS Borehole Records SD80SE406 taken from the additional Suez controlled land indicate that groundwater was a minimum of 20m below ground level (bgl). There are numerous other boreholes within the Suez controlled land, none of which have recorded any groundwater strikes.

The environmental sensitivity of the ground conditions at the site location has been examined using the online DEFRA Magic Map service. A summary of this information can be seen in Table 3 below.

Classification	Classification at the site
Nitrate Vulnerable Zone (NVZ)	Yes
Source Protection Zone	None recorded
Aquifer (Bedrock)	Principal
Aquifer (Superficial)	Secondary (Undifferentiated)
Groundwater Vulnerability	Medium - Low

Table 3: Groundwater Sensitivity Classification

4.2 Surface Water

The site is located in Flood Zone 1 and is 75m south of Moston Brook, a watercourse that appears to run in a general north eastern direction.

Figure 2: Surface Water Flood Map Extract

4.3 Surrounding Land Uses

Consideration has been given to the sensitive land uses surrounding the site. Table 4 below provides a summary of this information.

Sensitive Land Use	Distance	Direction
Residential Property	<50m	West
Commercial	50m	West
Agricultural	-	N/A
Industrial	<50m	Southeast

Table 4: Surrounding Sensitive Land Uses

4.4 Sensitivity Analysis

The site location is of moderate environmental sensitivity given the medium-low groundwater vulnerability and the location of the principal aquifer in the bedrock material beneath the site.

5 PRELIMINARY CONCEPTUAL MODEL

5.1 Introduction

The preliminary risk assessment draws together potential contamination sources, exposure pathways and sensitive receptors identified during the desk top study and site walkover survey. The objectives of the preliminary risk assessment process are to:

- Determine the sources of contamination;
- Identify specific potential contaminants of concern;
- Identify media (soil, groundwater, soil gases) which could be affected;
- Identify/ delineate, where possible, contaminant migration and exposure pathways;
- Identify possible receptors, including their relative potential sensitivity to contaminants given the nature of exposure; and
- Construct a preliminary conceptual model for the site which clarifies the mechanisms by which the site may present a risk, highlighting those sources of risk which will require further assessment and those which can be eliminated.

The preliminary conceptual model, which had revised and developed in light of investigation and findings, provides a description of three elements, namely.

- i. The actual and probable nature extent and location of contaminants, the SOURCE;
- ii. The likely migration PATHWAYS by which contaminants may reach receptors; and
- iii. The potential existing and reasonably foreseeable on-site and off-site RECEPTORS to contamination.

This information enables the development of plausible pollutant linkages between the sources of contamination and receptors and thus an estimation of the risks that may be present.

It should be noted that the site will ultimately designed with impermeable surfacing to the main public and operational areas. The effective sealing of these surfaces will mean that there is reduced scope for linkages between anything happening above ground causing issues below ground.

5.2 Contaminants

Potential sources of contamination for the site are presented in Table 5.

Source	Potential Contaminants	Medium Affected
Agriculture	Arsenic, copper, carbon tetrachloride, ethylene dibromide, and methylene chloride; pesticides; insecticides; herbicides; grain fumigants.	Soil
Timber Yard	Phenol, propanone, aromatic hydrocarbons, PAHs.	Soil
Recycling Centre	Oil/fuel hydrocarbons, PAHs, chlorinated aliphatic hydrocarbons, chlorinated aromatic hydrocarbons, PCBs, Dioxins & furans.	Soil
Landfill	Oil/fuel hydrocarbons, PAHs, chlorinated aliphatic hydrocarbons, chlorinated aromatic hydrocarbons, PCBs, Dioxins & furans.	Soil

Table 5: Potential Contamination Sources

5.3 Potential Exposure Pathways

Potential exposure pathways considered comprise:

- Dermal Contact	Skin contact with soil, dust or water.
- Ingestion	Consuming soil, dust, water or vegetables.
- Inhalation	Breathing in of soil, dust, or vapours.
- Plant Uptake	Contaminant uptake and bio-accumulation from soil or water.
- Impact on controlled waters	Pollution due to leaching through soil, release from soil matrix and material degradation.
- Buried services corrosion attack	Attack from soil or water-based contaminants, leaching from soil matrix and material degradation.
- Corrosion/ attack on in ground structures	Attack from soil or water-based contamination, or accumulation of hazardous gas resulting in explosion or fire

5.4 Potential Receptors

The following potential receptors (on and off site) have been identified in Table 6.

Sensitive Receptors	
A	Humans using the site during the construction process
B	Humans living or working on or close to the site, post construction
C	Controlled Waters – Surface Waters (rivers and streams)
D	Perched Groundwater in made ground and controlled waters (groundwater-Principal Aquifer)
E	Local Flora and Fauna during and post demolition and construction
F	Property (inc building structure and services)

Table 6: Potential Receptors

5.5 Pollutant Linkages

For each (potential) contamination source there are potential pollutant linkages with all receptors. However, in the context of this site, not all of the pollutant linkages are plausible. The likelihood of the various pathways linking the sources to the receptors is presented in Table 7.

Source/ Contaminated Medium	Pathway	Receptor					
		A	B	C	D	E	F
Soil	Ingestion	P	U	U	X	U	X
	Dermal or direct contact	P	U	P	X	U	U
	Inhalation	P	U	X	X	X	X
	Groundwater	X	X	X	X	X	X
	Surface Water	U	U	X	U	U	U
	Infrastructure/Drainage	U	U	U	U	U	U
Groundwater	Ingestion	U	U	X	X	U	X
	Dermal or direct contact	U	U	X	X	U	X
	Inhalation	U	U	X	X	U	X
	Groundwater	U	U	U	U	U	U
	Surface Water	U	U	U	U	U	U
Key to Receptors: A = Humans prior to construction B = Humans post construction C = Surface Water D = Groundwater E = Flora & Forna F = Buildings & Service Key to harmfulness of source: S = Significant Pathway P = Possible Pathway U = Unlikely Pathway X = Not Applicable							

Table 7: Pollutant Linkages

5.6 Preliminary Contamination Hazard Assessment

The preliminary hazard assessment is based on current available guidance published by a number of sources as summarised in Appendix D. The preliminary hazard assessment is based upon the desktop study and site walkover information.

The preliminary hazard assessment is a qualitative assessment of the risks posed by each viable pollution link identified. The hazard assessment leads to a recommended subsequent activity that could be:

- ACTION REQUIRED (AR) in the short term to break existing source-pathway-receptor link;
- SITE INVESTIGATION REQUIRED (SI) with objectives for risk estimation; or
- NO ACTION REQUIRED (NAR) at this stage.

Table 8 contains the hazard assessment for the site.

Hazard Identification			Hazard Assessment			
Source	Pathway	Receptor	Probability	Consequence	Risk	Hazard Assessment
Contaminated Soil	Ingestion	A	Possible	Moderate	Low	NAR
Contaminated Soil	Dermal or Direct Contact	A	Possible	Mild	Low	NAR
Contaminated Soil	Surface Water	A	Possible	Moderate	Low	AR
Contaminated Soil	Infrastructure/ Drainage	A	Possible	Mild	Low	NAR

Table 8: Preliminary Contamination Hazard Assessment

6 CONCLUSIONS

A Phase 1 Contaminated Land Assessment has been undertaken based upon the source-pathway-receptor model as defined in Part 11A of Environmental protection Act 1990, and in accordance with BS 10175:2009 'Investigation of Potentially Contaminated Sites – Code of Practice'.

The land use of the site has been agricultural before 1848-1895. The western side of the site had residential terraced housing constructed before 1909 and demolished before 1975, to accommodate the expansion of a timber yard. This was then converted into a recycling centre sometime before 1990 and is still operating presently. The whole site area is covered by hardstanding. Local authorised industrial processes currently active include; Waste Disposal Services, Wire Products, Garage Services, Food Products, Car body repairs and car painters & sprayers, Car Breakers & Dismantlers, Commercial Vehicle Manufacturers, Petrol Filling Stations and Engineers – General, within 250m of the site. The site has historic use as a landfill site and currently operates as a waste disposal site. These past and present uses have associated risks of land contamination and contaminants associated with each.

As the site is currently covered in hardstanding the potential for contaminants to be found on site is low and the probability of interaction with people is low. There is a risk from surface water of contaminants flowing off-site, as the site is predominantly impermeable. But it currently benefits from a formal surface water drainage network which will be improved as part of our redevelopment works. Included within this network is an emergency shut off valve in case of a spillage of potentially contaminated material that is likely to enter the drainage network.

Further, there is a risk during construction to people due to breaking ground and the potential contaminants from historic uses, these should be considered and mitigated where possible. The risk of harm was found to be low from its current and historic site uses and the receptors assessed in the Preliminary conceptual model.

The proposed development will mitigate any potential contaminants after construction by blocking pollution pathways from the ground being covered in hardstanding.

It is recommended that if evidence of contamination is found during construction that testing is undertaken and, if necessary, mitigation measures are undertaken. The potential presence of asbestos will require further investigation prior to demolition/construction during the detailed design.

In conclusion, from the Preliminary Conceptual Model, there is nothing regarding contamination for the site that would preclude planning consent.

Introduction

The Environment Act 1995 has made site sensitivity a key issue, as the legislation pays as much attention to the pathways by which contamination could spread, and to the vulnerable targets of contamination, as it does the potential sources of contamination. For this reason, Landmark's Site Sensitivity maps and Datasheet(s) place great emphasis on statutory data provided by the Environment Agency/Natural Resources Wales and the Scottish Environment Protection Agency; it also incorporates data from Natural England (and the Scottish and Welsh equivalents) and Local Authorities; and highlights hydrogeological features required by environmental and geotechnical consultants. It does not include any information concerning past uses of land. The datasheet is produced by querying the Landmark database to a distance defined by the client from a site boundary provided by the client. In this datasheet the National Grid References (NGRs) are rounded to the nearest 10m in accordance with Landmark's agreements with a number of Data Suppliers.

Index Map

For ease of identification, your site and buffer have been split into Slices, Segments and Quadrants. These are illustrated on the Index Map opposite and explained further below.

Slice
Each slice represents a 1:10,000 plot area (2.7km x 2.7km) for your site and buffer. A large site and buffer may be made up of several slices (represented by a red outline), that are referenced by letters of the alphabet, starting from the bottom left corner of the slice "grid". This grid does not relate to National Grid lines but is designed to give best fit over the site and buffer.

Segment
A segment represents a 1:2,500 plot area. Segments that have plot files associated with them are shown in dark green, others in light blue. These are numbered from the bottom left hand corner within each slice.

Quadrant
A quadrant is a quarter of a segment. These are labelled as NW, NE, SW, SE and are referenced in the datasheet to allow features to be quickly located on plots. Therefore a feature that has a quadrant reference of A7NW will be in Slice A, Segment 7 and the NW Quadrant.

Lancashire And Furness

Published 1848

Source map scale - 1:10,560

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840's. In 1854 the 1:2,500 scale was adopted for mapping urban areas; these maps were used to update the 1:10,560 maps. The published date given therefore is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas. In the late 1940's, a Provisional Edition was produced, which updated the 1:10,560 mapping from a number of sources. The maps appear unfinished - with all military camps and other strategic sites removed. These maps were initially overprinted with the National Grid. In 1970, the first 1:10,000 maps were produced using the Transverse Mercator Projection. The revision process continued until recently, with new editions appearing every 10 years or so for urban areas.

In the late 1940's, a Provisional Edition was produced, which updated the 1:10,560 mapping from a number of sources. The maps appear unfinished - with all military camps and other strategic sites removed. These maps were initially overprinted with the National Grid. In 1970, the first 1:10,000 maps were produced using the Transverse Mercator Projection. The revision process continued until recently, with new editions appearing every 10 years or so for urban areas.

Lancashire And Furness

Published 1909 - 1910

Source map scale - 1:10,560

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840's. In 1854 the 1:2,500 scale was adopted for mapping urban areas; these maps were used to update the 1:10,560 maps. The published date given therefore is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas. In the late 1940's, a Provisional Edition was produced, which updated the 1:10,560 mapping from a number of sources. The maps appear unfinished - with all military camps and other strategic sites removed. These maps were initially overprinted with the National Grid. Manchester

Published 1975

Source map scale - 1:25,000

These maps were produced by the Russian military during the Cold War between 1950 and 1997, and cover 103 towns and cities throughout the U.K. The maps are produced at 1:25,000, 1:10,000 and 1:5,000 scale, and show detailed land use, with colour-coded areas for development, green areas, and non-developed areas. Buildings are coloured black and important building uses (such as hospitals, post offices, factories etc.) are numbered, with a numbered key describing their use. They were produced by the Russians for the benefit of navigation, as well as strategic military sites and transport hubs, for use if they were to have invaded the U.K. The detailed information provided indicates that the areas were surveyed using land-based personnel, on the ground, in the cities that are mapped.

VectorMap Local
Published 2021
Source map scale - 1:10,000

VectorMap Local (Raster) is Ordnance Survey's highest detailed 'backdrop' mapping product. These maps are produced from OS's VectorMap Local, a simple vector dataset at a nominal scale of 1:10,000, covering the whole of Great Britain, that has been designed for creating graphical mapping. OS VectorMap Local is derived from large-scale information surveyed at 1:1250 scale (covering major towns and cities), 1:2500 scale (smaller towns, villages and developed rural areas), and 1:10 000 scale (mountain, moorland and river estuary areas).

Ordnance Survey Plan
Published 1951
Source map scale - 1:1,250

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840's. In 1854 the 1:2,500 scale was adopted for mapping urban areas and by 1896 it covered the whole of what were considered to be the cultivated parts of Great Britain. The published date given below is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas.

Supply of Unpublished Survey Information

Published 1975 - 1976

Source map scale - 1:1,250

SUSI maps (Supply of Unpublished Survey Information) were produced between 1972 and 1977, mainly for internal use at Ordnance Survey. These were more of a 'work-in-progress' plan as they showed updates of individual areas on a map. These maps were unpublished, and they do not represent a single moment in time. They were produced at both 1:2,500 and 1:1,250 scales.

Appendix C

Environment Agency's Aquifer Designations

AQUIFERS

Understanding the new aquifer designation maps.

What are the new aquifer designations?

We help to protect groundwater by identifying different types of aquifer – underground layers of water-bearing permeable rock or drift deposits from which groundwater can be extracted.

From 1 April 2010, our Groundwater Protection Policy will be using aquifer designations that are consistent with the Water Framework Directive. These designations reflect the importance of aquifers in terms of groundwater as a resource (drinking water supply) but also their role in supporting surface water flows and wetland ecosystems.

The aquifer designation data is based on geological mapping provided by the British Geological Survey. It will be updated regularly to reflect their ongoing programme of improvements to these maps. We gratefully acknowledge this assistance.

The maps are split into two different types of aquifer designation:

- **Superficial (Drift)** – permeable unconsolidated (loose) deposits. For example, sands and gravels.
- **Bedrock** – solid permeable formations e.g., sandstone, chalk and limestone.

The maps display the following aquifer designations.

Principal Aquifers

- These are layers of rock or drift deposits that have high intergranular and/or fracture permeability – meaning they usually provide a high level of water storage. They may support water supply and/or river base flow on a strategic scale. In most cases, principal aquifers are aquifers previously designated as major aquifer.

Secondary Aquifers

These include a wide range of rock layers or drift deposits with an equally wide range of water permeability and storage. Secondary aquifers are subdivided into two types:

- **Secondary A** – permeable layers capable of supporting water supplies at a local rather than strategic scale and in some cases forming an important source of base flow to rivers. These are generally aquifers formerly classified as minor aquifers.
- **Secondary B** – predominantly lower permeability layers which may store and yield limited amounts of groundwater due to localised features such as fissures, thin permeable horizons and weathering. These are generally the water bearing parts of the former non-aquifers.
- **Secondary Undifferentiated** – has been assigned in cases where it has not been possible to attribute either category A or B to a rock type. In most cases, this means that the layer in question has previously been designated as both minor and non-aquifer in different locations due to the variable characteristics of the rock type.

Unproductive Strata

These are rock layers or drift deposits with low permeability that have negligible significance for water supply or river base flow.

Note: We are only able to display the principal and secondary aquifers as coloured areas on the maps. All uncoloured areas on the bedrock designation map will be unproductive strata. However, for uncoloured areas on the superficial (drift) designation map you will not be able to distinguish between areas of unproductive strata and areas where no drift is present. To do this you will need to consult the published geological survey maps.

Data and our policy

If the new aquifer designations result in a different Groundwater Protection Policy applying to a particular location, we will continue working to any agreements we have previously made, provided there is clear evidence of those agreements.

For the purposes of our Groundwater Protection Policy the following default position applies, unless there is site specific information to the contrary.

- if no superficial (drift) aquifers are shown, we will use the bedrock designation;
- in areas where the bedrock designation shows unproductive strata (the uncoloured areas) we will use the superficial (drift) designation;
- in all other areas, we will use the more sensitive of the two designations (e.g. if secondary drift overlies principal bedrock, we will adopt an overall designation of principal).

What about the previous groundwater vulnerability maps?

If you have been used to using our older groundwater vulnerability maps, aquifers previously designated as major and minor now become principal and secondary respectively.

Our groundwater vulnerability maps have not been completely withdrawn because the new maps do not provide information on surface soils. You will need to refer to the groundwater vulnerability maps if you are assessing activities on undisturbed natural soils (e.g. agricultural land) and need the soil classes. In this case you should disregard the old geological classes and combine the soils information with the new aquifer designations. The older groundwater vulnerability maps are still available upon request from our **National Customer Contact Centre** (fee payable).

HOW THE ZONES WORK

How do we define groundwater source protection zones?

The shape and size of a zone depends on the condition of the ground, how the groundwater is removed and other environmental factors. When we define a zone we find out how the groundwater behaves in that area, what constructions there are to get the water out into the public water supply, and the process for doing this. From this we can develop a model of the groundwater environment on which to define the zones.

We divide groundwater source catchments into three zones. The zones are divided as follows:

SPZ1 – Inner protection zone

Defined as the 50 day travel time from any point below the water table to the source. This zone has a minimum radius of 50 metres.

SPZ2 – Outer protection zone

Defined by a 400 day travel time from a point of below the water table. The previous methodology gave an option to define SPZ2 as the minimum recharge area required to support 25 per cent of the protected yield. This option is no longer available in defining new SPZs and instead this zone has a minimum radius of 250 or 500 metres around the source, depending on the size of the abstraction.

SPZ3 – Source catchment protection zone

Defined as the area around a source within which all groundwater recharge is presumed to be discharged at the source. In confined aquifers, the source catchment may be displaced some distance from the source. For heavily exploited aquifers, the final Source Catchment Protection Zone can be defined as the whole aquifer recharge area where the ratio of groundwater abstraction to aquifer recharge (average recharge multiplied by outcrop area) is >0.75 . There is still the need to define individual source protection areas to assist operators in catchment management.

Former zone of special interest

A fourth zone SPZ4 or 'Zone of Special Interest' was previously defined for some sources. SPZ4 usually represented a surface water catchment which drains into the aquifer feeding the groundwater supply (i.e. catchment draining to a disappearing stream). In the future, this zone will be incorporated into one of the other zones, SPZ 1, 2 or 3, whichever is appropriate in the particular case, or become a safeguard zone.

Appendix D

Summary of Guidance on Preliminary Hazard Assessment

ENVIRONMENTAL RISK ASSESSMENT METHODOLOGY AND TERMINOLOGY

Legislation Overview

This report includes hazard identification and environmental risk assessment in line with the risk-based methods referred to in relevant UK legislation and guidance. Government environmental policy is based upon a 'suitable for use approach' which is relevant to both the current use of land and also to any proposed future use. When considering the current use of land, Part IIA of the Environment Protection Act 1990 (EPA 1990) provides the regulatory regime, which was introduced by Section 57 of the Environment Act 1995, which came into force in England on 1 April 2000. The main objective of introducing the Part IIA regime is to provide an improved system for the identification and remediation of land where contamination is causing unacceptable risks to human health or the wider environment given the current use of the land.

Part IIA provides a statutory definition of contaminated land under Section 78A(2) as:

'any land which appears to the Local Authority in whose area it is situated to be in such a condition, by reason of substances in, on or under the land, that:

- a) Significant harm is being caused or there is a significant possibility of such harm being caused;*
- or*
- b) Pollution of controlled waters is being, or is likely to be, caused.'*

In order to assist in establishing if there is a '*significant possibility of significant harm*' there must be a '*pollutant linkage*' for potential harm to exist. That means there must be a source(s) of contamination, sensitive receptors present and a connection or pathway between the two. This combination of source-pathway-receptor is termed a '*pollutant linkage or SPR linkage*'.

Part IIA of The Environment Protection Act 1990 is supported by a substantial quantity of guidance and other Regulations, especially DEFRA Circular 01/2006 Contaminated Land (this replaces DETR Circular 02/2000). Part IIA defines the duties of Local Authorities in dealing with it. Part IIA places contaminated land responsibility as part of planning and redevelopment process rather than Local Authority direct action except in situations of very high pollution risk. In the planning process guidance is provided by Planning Policy Statement 23 (PPS23), which requires that a site which has been developed shall not be capable of being determined 'contaminated land' under Part IIA. In practice, Planning Authorities require sites being developed to have a lower level of risk post development than the higher level of risk that is required in order to determine a site as being contaminated in accordance with Part IIA. This is to ensure that there is a suitable zone of safety below the level for Part IIA determination and prevent recently developed sites becoming reclassified as contaminated land if there are future legislative or technical changes (e.g. a substance is subsequently found to be more toxic than previously assessed this increases its hazard).

The criteria for assessing levels of pollutants and hence determining whether a site represents a hazard are based on a range of techniques, models and guidance. Within this context it is relevant to note that Government objectives are:

- a. to identify and remove unacceptable risks to human health and the environment;
- b. to seek to bring damaged land back into beneficial use;
- c. to seek to ensure that the cost burdens faced by individuals, companies and society as a whole are proportionate, manageable and economically sustainable.

These three objectives underlie the 'suitable for use' approach to remediation of contaminated land. The 'suitable for use' approach focuses on the risks caused by land contamination. The approach recognises that the risks presented by any given level of contamination will vary greatly according to the use of the land and a wide range of other factors, such as the underlying geology of the site. Risks therefore should be addressed on a site by site basis.

The 'suitable for use' approach then consists of three elements:

- a) *ensuring that land is suitable for its current use* – in other words, identifying any land where contamination is causing unacceptable risks to human health and the environment, assessed on the basis of the current use and circumstances of the land, and returning such land to a condition where such risks no longer arise ('remediating' the land); the contaminated land regime provides the regulatory mechanisms to achieve this;
- b) *Ensuring that land is made suitable for any new use, as planning permission is given for that new use* – in other words, assessing the potential risks from contamination, on the basis of the proposed future use and circumstances, before official permission is given for the development and, where necessary to avoid unacceptable risks to human health and the environment, remediating the land before the new use commences; this is the role of the town and country planning and building control regimes; and
- c) *limiting requirements for remediation to the work necessary to prevent unacceptable risks to human health or the environment in relation to the current use of future use of the land for which planning permission is being sought* – in other words, recognising that the risks from contaminated land can be satisfactorily assessed only in the context of specific uses of the land (whether current or proposed), and that any attempt to guess what might be needed at some time in the future for other uses is likely to result either in premature work (thereby running the risk of distorting social, economic and environmental priorities) or in unnecessary work (thereby wasting resources).

The mere presence of pollutants does not therefore necessarily warrant action, and consideration must be given to the scale of risk involved for the use that the site has, and will have in the future.

Risk Assessment

Current practice recommends that the determination of potential liabilities that could arise from land contamination be carried out using the process of risk assessment, whereby 'risk' is defined as:

- a) *The probability or frequency or occurrence of a defined hazard; and*
- b) *The magnitude (including the seriousness) of the consequences.*

The UK's approach to the assessment of environmental risk is set out by the Department of the Environment (1995) publication 'A Guide to Risk Assessment and Risk Management for Environmental Protection'. This established an iterative, systematic staged process which comprises:

- a) Hazard identification;
- b) Hazard assessment;
- c) Risk estimation;
- d) Risk evaluation;
- e) Risk assessment.

At each stage during the development process the above steps are repeated as more detailed information becomes available for the site.

For an environmental risk to be present, all three of the following elements must be present:

- **Source:** hazardous substance that has the potential to cause adverse impacts;
- **Receptor:** target that may be affected by contamination: examples include human occupants/users of site, water resources (rivers or groundwater) or structures;
- **Pathway:** a viable route whereby a hazardous substance may come into contact with the receptor.

The absence of one or more of each component (source, pathway, receptor) would prevent a pollutant linkage being established and there would be no significant environmental risk.

The identification of potential pollutant linkages is based on a Conceptual Model of the site, which is subject to continual refinement as additional data becomes available. As part of a Phase 1 Investigation (desk study and site walk over) a Preliminary Conceptual Site Model (PCSM) is formed. Based on the PCSM, potential pollutant linkages can be assessed. If the PCSM and hazard assessment indicate that a pollution linkage is not of significance then no further assessment or action is required due to this linkage. For each significant and possible linkage a variety of responses ranging from immediate remedial action or risk management or, more commonly further investigation and risk assessment. This next stage is termed a Phase II Main Site Investigation and should provide additional data to allow refinement of the Conceptual Site Model and assess the level of risk from each pollutant linkage.

Definition of Risk Assessment Terminology

The criteria used for risk assessments are broadly based on those presented in section 6.3 of the CIRIA Report 'Contaminated Land Risk Assessment: A Guide to Good Practice' (CIRIA Report C552). The severity of the risk is classified according to the criteria in Table B.1 below.

Severe	Acute risks to human health Catastrophic damage to buildings/property (e.g., by explosion) Major pollution of controlled waters (watercourses or groundwater)
Medium	Chronic (long term) risk to human health Pollution of sensitive controlled waters (surface waters or aquifers) Significant effects on sensitive ecosystems or species
Mild	Pollution of non-sensitive waters Significant damage to buildings or structures requirement for protective equipment during site works to mitigate health effects
Minor	Damage to non-sensitive ecosystems or species Minor damage to buildings or structures

Table B.1: Severity/Consequence of Risk

The probability of the risk occurring is classified according to criteria given in Table B.2 below:

High likelihood	Pollutant linkage may be present, and risk is almost certain to occur in the long term or there is evidence of harm to the receptor
Likely	Pollutant linkage may be present and it is probable that the risk will occur over the long term
Low likelihood	Pollutant linkage may be present and there is a possibility of the risk occurring although there is no certainty that it will do so
Unlikely	Pollutant linkage may be present but the circumstances under which harm would occur are improbable

Table B.2: Probability of Risk Occurring

An overall evaluation of the level of risk is gained from a comparison of the severity and probability as shown in Table B.3 below:

		Severity			
		Severe	Medium	Mild	Minor
Probability	High likelihood	Very high risk	High risk	Moderate risk	Moderate/low risk
	Likely	High risk	Moderate risk	Moderate/low risk	Low risk
	Low likelihood	Moderate risk	Moderate/low risk	Low risk	Very low risk
	Unlikely	Moderate/low risk	Low risk	Very low risk	Very low risk

Table B.3: Comparison of Severity and Probability

The various risk rankings provide guidance for recommended actions, whether this is:

- AR - Action required, remediation or mitigation or site investigation works required
- SIR - Site investigation required, further assessment is required
- NAR - No action required

A description of the evaluated risk as is follows:

Evaluated Risk	Recommended Actions
Very high risk	AR: There is a high probability that severe harm could arise to a designated receptor from an identified hazard, OR, there is evidence that severe harm to a designated receptor is currently happening. This risk, if realised, is likely to result in a substantial liability. Urgent investigation (if not undertaken already) and remediation are likely to be required.
High risk	AR: Harm is likely to arise to a designated receptor from an identified hazard. Realisation of the risk is likely to present a substantial liability. Urgent investigation (if not undertaken already) is required and remedial works may be necessary in the short term and are likely over the long term.
Moderate risk	SI: It is possible that harm could arise to a designated receptor from an identified hazard. However, it is relatively unlikely that any such harm would be severe, or if any harm were to occur it is more likely that the harm would be relatively mild. Investigation (if not already undertaken) is normally required to clarify the risk and to determine the potential liability. Some remedial works may be required in the longer term.
Low risk	NAR: It is possible that harm could arise to a designated receptor from an identified hazard, but there is a low likelihood of this hazard occurring and if realised, harm would at worst normally be mild.
Very low risk	NAR: There is a low possibility that harm could arise to a receptor. In the event of such harm being realised, it is not likely to be severe.

Table B.4: Description of the Classified Risks and Likely Action Required

Management of Contaminated Land

When a risk assessment of the site has been completed and this indicates that remedial works are required, the main guidance in managing this process is set out in the DEFRA/EA publication CLR11 (2004) 'Model Procedures for the Management of and Contamination'. The stages of managing remediation are as follows:

- a) Options Appraisal and develop Remediation Strategy;
- b) Develop Implementation Plan and Verification Plan;
- c) Remediation, Verification and Monitoring.

The Remediation Strategy sets out the remediation targets, identifies technically feasible remedial solutions and presents an evaluation of the options so that these can be assessed enabling that the most suitable solution is adopted. An outline of the proposed remedial method should be presented. Agreement should be sought of the appropriate statutory bodies for the Remediation Strategy before proceeding to the next stage.

The Implementation Plan is a detailed method statement setting out how the remediation is to be carried out including stating how the site will be managed, welfare procedures, health and safety considerations together with practical measures such as details of temporary works, programme of works, waste management licences and regulatory consents required. Agreement should again be sought of the appropriate statutory bodies for this Plan.

The Verification Plan sets out the requirements for gathering data to demonstrate that the remediation has met the required remediation objectives and criteria. The Verification Plan presents the requirements for a wide range of issues including the level of supervision, sampling and testing regimes for treated materials, waste and imported materials, required monitoring works during and post remediation, how compliance with all licences and consents will be checked etc. Agreement should again be sought of the appropriate statutory bodies for the Verification Plan. On completion of the remediation a Verification Report should be produced to provide a complete record of all remediation activities on site and the data collected as required in the Verification Plan. The Verification Report should demonstrate that the remediation has met the remedial targets to show that the site is suitable for the proposed use.

Appendix E

Notes on Limitations

Notes on Limitations

The work undertaken to provide the basis of this report comprised a study of available documented information from a variety of sources (including the client), together with a site walkover and meetings and discussions with relevant authorities and interested parties. The opinions given in this report have been dictated by the finite data on which they are based and are relevant only to the purpose for which the report was commissioned. The information reviewed should not be considered exhaustive and has been accepted in good faith as provided true and representative data pertaining to site conditions. Should additional information become available which may affect the opinions expressed within this report, then Canham Consulting Ltd reserves the right to review such information and, if required, to modify the opinions accordingly.

It should be noted that any risks identified in this report are perceived risks based upon the information reviewed; actual risks can only be assessed following a physical intrusive investigation of the site.
