Structural Engineer's Conformity Statement

Blue Roof Design – Charles Street Project

I confirm that in my capacity as Structural Engineer for the Charles Street project, the blue roof system has been considered as part of the structural design.

The blue roof has been specifically designed and accounted for during the structural calculations and design check including, but not limited to, imposed loads, permanent loads, water attenuation depths, construction loading and worst-case storm events. As such, the structure has been designed to safely withstand these loads in compliance with British Standards and Eurocodes, as well as guidance and statutory documents.

To the best of my knowledge and belief, the structure is suitable to take the blue roof as shown subject to the construction of the project being built in compliance with the structural drawings, specifications and assumptions.

Signed for and on behalf of the Structural Engineer.
