

Location Plan

Install 2no. integrated Habibat Bat Box 003 units (or similar) at high level on the southeast and north-west elevations of the building for roosting bats. Boxes should be positioned between 2.5–5m above ground level and located to minimise disturbance, facing away from major sources of human activity and artificial lighting. Placement across differing elevations will provide a range of thermal conditions suitable for roosting.

Install 4 no. integrated Common Swift nest boxes at high level (minimum 5m above ground level), preferably beneath eaves or soffits. Boxes should be grouped closely together to encourage colonial nesting behaviour, with a clear and unobstructed flight path to each entrance. Locations directly above windows should be avoided where practicable. An eastern elevation has been selected to avoid south-facing aspects, where excessive sunlight may result in overheating of nest chambers.
