Asbestos Removal Scope

Due to ongoing risks from asbestos, removal of contaminated material must take place.

The removal works will be limited to areas deemed contaminated. In Ward 90, the existing lath and plaster has been found to be contaminated with asbestos.

The metal lath and plaster has a relatively ‘modern’ construction methodology.

The limited scope will facilitate the wider refurbishment of Ward 90. The removal of the contaminated lath and plaster will facilitate inspections of the roof structure which will enable repairs to take place and remove ongoing risk from asbestos.

It is envisioned that the areas where the lath and plaster have been removed will be replaced with foil backed plaster board. We do not yet know the full design of the fit out below.
